1.8 SCHEDULE

1.1 Introduction

Human nature needs to have places of worship in place of residence, and these places must have all the means to ensure comfort and safety. General design process requires the introduction of all aspects of the building to be created both in the architectural appearance of the building and how to distribute the spaces and areas within various service sections linked to each other, or structural terms dealing with structural system capable of carrying the loads affecting the building taking into account the minimum possible economical system construction as is compatible with the architectural design choice.

The project includes the architectural and structural design of Theater, Library, Management rooms, Galleries, Mosque, Restaurant, Conference Hall Lecture halls, Stores, Computer halls and Concerns literal. Distributing columns and bridges in line with architectural and design elements from components to bases and foundations and structural schemes and processing in order to produce an integrated project and implementation.

1.2 Research Problem:

The problem centralized in the project analysis, architectural design and structural system of all sections of the buildings. Forces and loads of structural components, such as beams and columns, ribs, etc. will be analyzed in the project. Then the dimensions and the arming of various structural elements will be determined.

1.3 An Overview of the Project:

This project includes the structural design of theater, conference hall, lecture halls, computer halls and concerns literal that fulfilled all the requirements for comfort and safety according to usage requirements.

The theater is a hall and accommodates 208 people with an area of nearly 295 square meters.

The Cafeteria has an area of 313 m² and can accommodate 55 people.

The offices section has an area of 1900 m².

The administration section has an area of 375 m².

The educational section (class rooms) has an area of 5400 m².

The computer sections have an area of 1320 m².

The corridors, main lobby and other services have an area of 6200 m².

Instruction section: have an area 1780 m².

1.4 The Objective of the Project

The objectives of the project are divided into two parts:

1. Architectural Goals:

In this project architectural design is not the main goal as civil and building engineers, however in this building it was necessary to achieve beauty, utility requirements, cost and durability, which are the basic architectural design requirements.

2. Structural Goals:

Structural design of the units will be done in this project with preparing all structural drawings for beams, slabs, columns, footings and shear walls to be ready for fulfillment on the location of the project.

1.5 Project Steps

1. Architectural design (construction drawings, elevations, sections, public location).
2. Study of the units structurally to identify structural elements, loads on the buildings, and the selection of appropriate structural system.
3. Distributing of columns to the chosen structural system.
4. Structural analysis of all structural elements of the units.
5. Structural design of all structural elements.
6. Preparation of construction drawings of the building to remove the executable image.
7. Writing project in accordance with the requirements of the construction engineering.

1.6 Reasons to Choose the Project:

The reason of selecting the project back to several things, including the conquest of skill in design for structural elements in buildings, in addition to increasing knowledge of machine construction systems in our country and other countries, as well as the conquest of scientific knowledge and the process followed in the design and implementation of construction projects and the structural engineer after graduation in the work market in the future.

This research was done to submit it to the department of civil engineering and architecture at the College of engineering and technology at Palestine Polytechnic University to meet graduation requirements and a Bachelor's degree in civil engineering for building engineering.

1.7 The scope of the Project

This project contains several chapters are detailed as follows:

- Chapter One: a general introduction to the project.
- Chapter Two: includes description of architectural project.
- Chapter Three: contains a description of the structural elements of the project.
- Chapter Four: Analysis and structural design of all structural elements.
- Chapter Five: The results that have been reached and recommendations.

2.6 PROJECT SECTIONS.

2.1 Introduction: -

Architectural description is the most important thing that should be considered when preparing for any project because of its importance in defining and understanding the nature of the project and its sections.

Architectural design requirements task must meet the desired job and human needs in the present time, these terms are the functional, lasting beauty and economy terms, it is important that these terms can interact between each other in harmony to achieve our vision of optimal design and get an integrated and comprehensive architectural design. This is achieved by understanding the functional demands of the building and space as well as taking into account nature movement of each part of the project.

2.2: - Project Location.

The project is located at Al -Samu' south of Hebron (775m above the sea level) as shown in the picture. The suggested location serves the southern part of the district with a high population including Yutta, Dura, Ithna, Al-Dahryah.

2.3 The Main Elements in the Management college: -

The project areas are divided into interior and exterior spaces tied together to achieve the goals that were found for it.

2.3.1 Interior Spaces:

The interior area of the project is 6600m² and 8520m² for movement spaces, thus the total interior space is 15120 m².

- Interior spaces are divided into:

- 1- Theater.
- 2- Computer sections.
- 3- Administration rooms.
- 4- Class Rooms.
- 5- Cafeteria.
- 6- Instruction Section.

➤ **Theater:**

It resides on one floor " basement floor", and it accommodates 208 people with an area of nearly 295 m² divided into:

- Entrance hall: has an area of 80 m².
- Theater Hall: has an area of 295 m².
- Lobby: has an area of 44 m².
- Sentry-box: has an area of 10 m².
- Stage: has an area of 29 m².
- Baths: has an area of 30 m².
- Theater management room: has an area of 43 m².

➤ **Administration Section:**

It has an area of 375 m² divided into:

- Lobbies: has an area of 134 m².
- Director General: has an area of 40 m².
- Secretariat: has an area of 17 m².
- Deputy Director: has an area of 37 m².
- Hall Meetings: has an area of 30 m².
- Places to wait: has an area of 80 m².
- Kitchen: has an area of 11 m².
- Baths: has an area of 26 m².

➤ **Cafeteria:**

It resides on the underground floor, and it accommodates 55 people with an area of nearly 313 m² divided into:

- Entrance hall: has an area of 15 m².
- Dining room: has an area of 157 m².
- Accounting: has an area of 28 m².
- Services: has an area of 20 m².
- Kitchen: has an area of 66 m².

➤ **Educational Section (class rooms):**

It has an area of 5400 m² divided into:

- Lecture hall: has an area of 2780 m².
- Sitting area: 890 m².
- Lobbies: has an area of 1680 m².
- Bath rooms: it has an area 50 m².

➤ **Instruction Section:**

It has an area of 1780 m² divided into:

- Instructors' offices: has an area of 1010 m².
- Share department office: has an area 40 m².
- Meetings room: has an area 30.
- Deputy Director office: has an area 35.
- Secretariat: has area 20.
- Kitchen area: has an area 88.
- Bathrooms: has an area 210.
- Sitting places: has an area 225.
- Lobbies: has an area 122.

➤ **Computer Sections:**

It has an area of 1320 m² divided into:

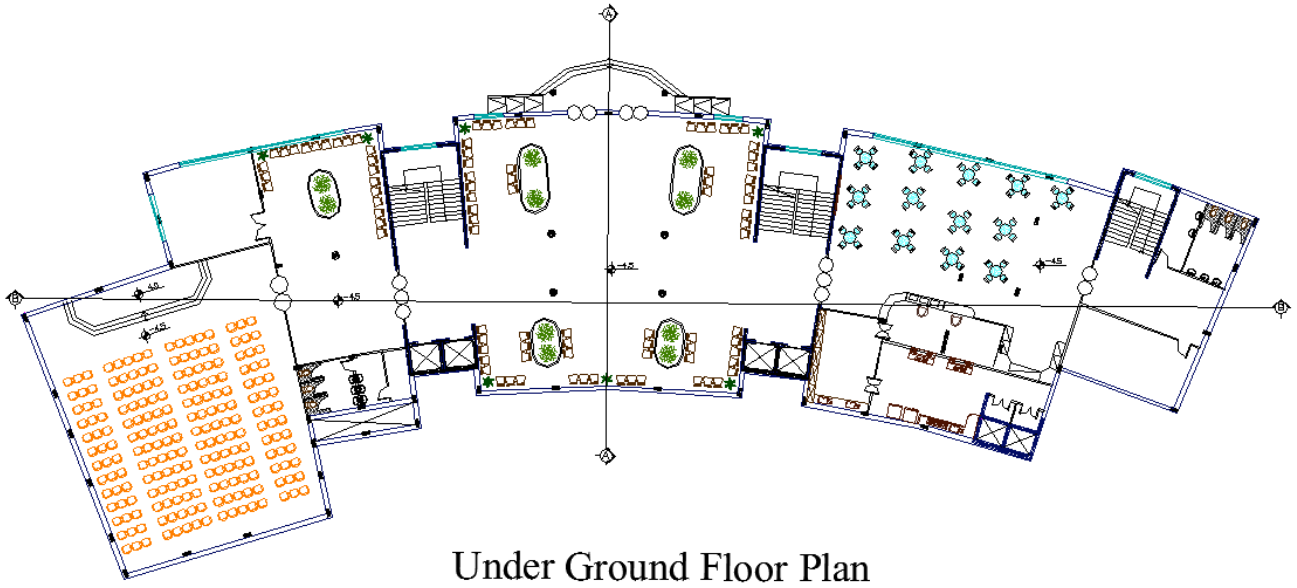

- Computer labs: v an area 1090 m².
- Sitting areas: have an area 230 m².
- Lobbies: have an area 164 m².
- Bath rooms: it has an area 96 m².

2.3.2 External Spaces:

Consisting of:

- Green spaces.
- Cars parking: It consists of 20 car parking with an area 300 m².
- Sitting areas

Structural Description

3.1 INTRODUCTION.

3.2 THE GOAL OF THE STRUCTURAL DESIGN.

3.3 SCIENTIFIC TESTS.

3.4 STAGES OF STRUCTURAL DESIGN.

3.5 LOADS ACTING ON THE BUILDING.

3.6 STRUCTURAL ELEMENTS OF THE BUILDING.

3.1 Introduction:

The main objective of the design process is to ensure the existence of necessary operating advantages with structural elements on the most suitable dimensions in terms of security and economic terms.

The knowledge of structural elements of any project is essential in the design of reinforced concrete structures to make comparisons between different types of these elements for the construction of safer system. So, the structural elements that go into the design of this project will be described.

3.2 The Goal of the Structural Design:

The structural design is an integrated and balanced structural system which is capable of carrying it and meets the established requirements and desires of users, and thus determines the structural elements from the following:

- 1- Factor of Safety: Is achieved by selecting sections for structural elements capable of withstanding the forces and resulting stresses.
- 2- Economy: Check by choosing the appropriate building materials and by choosing the perfect low-cost section.
- 3- Serviceability: To avoid excessive landing (deflection), fissures (cracks).
- 4- Preservation of architectural design.
- 5- Preserving the environment.

3.3 Scientific Tests:

Before the design of any construction project some tests must be done, tests of the soil to check the breaking strength, specifications, type, the underground water level and depth of the foundation layer. This is done through specific number of specified depths exploring holes done by the appropriate International Center for Geotechnical Engineering Studies (ICGES) in Bethlehem. Then the extracted samples were tested to measure the previous mentioned properties.

3.4 Stages for Structural Design:

We will divide the structural design of the project into two phases: -

1. The first stage: -
In this stage, the appropriate structural system of the project construction and the analysis of this system will be determined.
2. The second stage: - The structural design of each element of the set is detailed and modified according to the chosen construction system and structural executing blueprints.

3.5 Loads Acting on the Building:

There is a group of forces that the building must be designed to endure, this group consists of several types of loads which must be calculated and selected carefully because any errors in identifying and calculating these loads can reflect negatively on the structural design of various structural elements.

The loads that effect on any structure can be classified as follow:

3.5.1 Main Loads:

- a) Dead Loads.
- b) Live Loads.
- c) Environmental Loads.

3.5.1.1 Dead Loads.

The permanent forces resulting from gravity which are fixed in terms of amount and location and do not change during the age of the building, including the loads of the weight of structural elements and the weights of the permanent nonstructural elements like walls. It also includes the permanent lateral loads like the soil pressure on the basement walls.

The calculation of the loads requires the knowing of the dimensions of the structural elements and specific gravity of the materials used in the manufacturing of the structural elements.

Furthermore, falls within this definition the self-weight of the construction materials, like concrete, reinforcement rebars, insulation materials, plaster, mortar, tiles, and electrical & sanitary installation.

3.5.1.2 Live Loads.

Includes the loads which effect on the building base on the usage of it, they can be classified into the following:

- 3.5.1.2.1** Dynamic Loads: like the machines that produce vibrations.
- 3.5.1.2.2** Static Loads: their location can be changed from time to time, like furniture, partitions, machines, and stored materials.
- 3.5.1.2.3** People Loads: depends on the usage of the building.
- 3.5.1.2.4** Execution Loads: acts on the building during the execution process, like cranes.

TABLE 1.2 LIVE LOADS ON FLOORS

Loading Class No.	Types of floors	Min. Live Load per m ² of floor area	Alternative minimum live load
(1)	(2)	(3)	(4)
200	Floors in dwelling houses tenements, hospital wards, bed rooms and private sitting rooms in hostels and dormitories.	200 kg/m ² (2 kN/m ²)	Subject to a min. total load of 2.5 times the values in col. 3 for any given slab panel and 6 times the value in col. 3 for any given beam. This total load shall be assumed uniformly distributed on the entire area of the slab panel and the entire length of the beam.
250	Office floor other than entrance halls, floors of light workrooms.	250*-400 kg/m ² (2.5-4 kN/m ²)

Figure (3-1) Determination of live load code (page 25)

3.5.1.3 Environmental Loads: result from environmental factors, including snow loads, earth quick loads, and soil loads. Theses loads vary in both magnitude and location, the wind load even varies in direction, and it depends on the unit of area exposed to the wind.

Snow Loads:

Figure (3-2): snow loads.

Snow loads can be calculated by knowing the altitude using the table below by Jordanian code. (As-Samu / Hebron is 775m above sea level).

حمل الثلج (س _o) (كن/م ²)	ارتفاع المنشأ عن سطح البحر (h) (بالمتر)
0	250 > h
(h-250)/800	500 > h > 250
(h-400)/320	1500 > h > 500

Figure (3.3): Determination of snow loads code on surface (page 44).

Based on the scale of previous snow loads and after selecting the high building surface and that equals (775 m) according to item III snow load is calculated as follows:

$$SL = (h - 400) / 320$$

$$SL = (775 - 400) / 320 = 1.17 \text{ KN/m}^2$$

In case of inclined surfaces, the value of the snow load is multiplied by a slope factor C_s .

The value of C_s depends on: slope of the roof, Temperature of the roof, nature of roofing surface, and the existence of obstructions to sliding.

These values can be found from ASCE 7-05 Figure 7-2.

Earthquake Load:

Earthquakes produce horizontal and vertical vibrations due to the relative motion of the Earth rock layers, resulting in strong cut affects the origin and these loads must be taken into account in the design to ensure the resistance against earthquakes. This will be resisted by shear walls in a building on the construction accounts.

The load is determined based on location. (As-Samu south of Hebron) so (zone is 2A and $Z=0.15$).

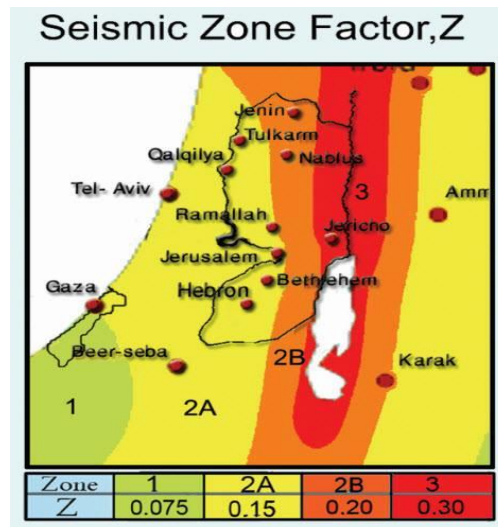

Figure (3-4): Earthquake map for Palestine.

Wind Loads:

Wind loads produce vertical forces on the building, and the wind load determination process depends on wind speed which changes with the height of the structure from the surface of the Earth and the location of the building itself, the surrounding buildings, and many other variables.

Figure (3-5): Wind Pressure on buildings.

3.5.2 Secondary Loads (Indirect Loads).

This includes the contraction resulting from the drying of the concrete and the expansion caused by the thermal effect and the settlement of the soil.

3.6 Structural Elements of the Building:

All buildings are usually consisting of a set of structural elements that work together to maintain the continuity of a building and its suitability for human use, and the most important of these slabs and beams and columns and load-bearing walls, etc.

- **Slabs:**

Structural elements are capable of delivering vertical forces due to the loads affecting the building's load-bearing structural elements such as beams, columns and walls, without distortions.

In this project, two types of components both in its appropriate place, and which will clarify the structural design in the subsequent chapter, and below these types:

- 1- One Way Ribbed Slab.
- 2- Tow Way Ribbed Slab.

Figure (3-6): One Way Ribbed Slab.

Figure (3-7): Two Way Ribbed Slab.

- **Stairs:**

The architectural elements used for vertical transmission between the different levels of the lever through the building, and will be one of inclusion type design development.

Figure (3-8): The shape of stairs.

- **Beams:**

The basic structural elements in moving load of tiles into columns, and are of two types:

- 1- Hidden Beam: Hidden inside Slabs.
- 2- Dropped Beam: (Paneled Beam).

Figure (3-9): Hidden Beam.

Figure (3-10): Paneled Beam.

- **Column:**

The column is an important element in moving loads of bridges to the foundations, it is essential to transfer the loads and the building, and therefore must be designed so as to be able to download and load them, and two rectangular and square concrete columns.

Figure (3-11): Column.

- **Shear wall:**

Is a structural system composed of braced panels (also known as shear panels) to counter the effects of lateral load acting on the building, the building contains a number of shear wall continued from Foundation to the end minaret

DESIGN OF STRUCTURAL MEMBERS

4-1 Introduction.

4-2 Design Method and Requirements.

4-3 Check of Minimum Thickness of Structural Member.

4-4 Design of Topping.

4-5 Design of One Way Rib Slab.

4.6 Design of Beam.

4-1 Introduction

Many structures are built of reinforced concrete: bridges, buildings, retaining walls, tunnels and others.

Reinforced concrete is logical union of two materials: plain concrete, which possesses high compressive strength but little tensile strength, and steel bars embedded in the concrete, which can provide the needed strength in tension.

Plain concrete is made by mixing cement, fine aggregate, coarse aggregate, water, and frequently admixtures.

Understanding of reinforced concrete behavior is still far from complete, building codes and specifications that give design procedures are continually changing to reflect latest knowledge.

Structural concrete can be classified into: -

- Lightweight concrete with unit weight from about 1350 to 1850 kg/m³.
- Normal weight concrete with unit weight from about 1800 to 2400 kg/m³.
- Heavyweight concrete with unit weight from about 3200 to 5600 kg/m³.

4-2 Design Method and Requirements

The design strength provided by a member is calculated in accordance with the requirements and assumptions of **ACI_code (318_08)**.

✓ Strength design method: -

In ultimate strength design method, the service loads are increased by factors to obtain the load at which failure is considered to be occurring.

This load called factored load or factored service load. The structure or structural element is then proportioned such that the strength is reached when factored load is acting. The computation of this strength takes into account the nonlinear stress-strain behavior of concrete.

The strength design method is expressed by the following,

$$\text{Strength provided} \geq \text{strength required to carry factored loads.}$$

NOTE: -

The statically calculation and the key plans dependent on the architectural plans.

• Code: -

ACI 2008

• Material: -

Concrete: -B300

$f_c' = 30 \text{ N/mm}^2 (\text{MPa})$ For circular section

but for rectangular section ($f_c' = 30 * 0.8 = 24 \text{MPa}$).

Reinforcement steel: -

The specified yield strength of the reinforcement { $f_y = 420 \text{ N/mm}^2 (\text{MPa})$ }.

✓ Factored loads: -

The factored loads for members in our project are determined by: -

$$W_u = 1.2 D_L + 1.6 L_L$$

ACI-code-318-08(9.2.1)

4.3 Check Thickness of Structural Member

Table4-1: - Minimum Thickness of Nonprestressed Beam or One-Way Slabs Unless Deflections Are Calculated. (ACI 318M-11).

Minimum thickness (h)				
Member	Simply supported	One end continuous	Both end continuous	Cantilever
solid one way slabs	L/20	L/24	L/28	L/10
Beams or ribbed one way slabs	L/16	L/18.5	L/21	L/8

Table (4.1): Check of Minimum Thickness of Structural Member.

For Rib: -

$$h_{\min} \text{for (one end continuous)} = L/18.5 = 4.12/18.5 = 22.3 \text{cm}$$

$$h_{\min} \text{for (both end continuous)} = L/21 = 4.14/21 = 19.7 \text{cm}$$

$$h_{\min} \text{for (both end continuous)} = L/21 = 3.39/21 = 16.1 \text{cm}$$

$$h_{\min} \text{for (one end continuous)} = L/18.5 = 3.76/18.5 = 20.3 \text{cm}$$

Take h = 35 cm

27 cm block + 8 cm topping = 35cm

For Beam: -

$$h_{\min} \text{for (one end continuous)} = L/18.5 = 5.81/18.5 = 31.4 \text{cm}$$

$$h_{\min} \text{for (both end continuous)} = L/21 = 3.47/21 = 16.5 \text{cm}$$

$$h_{\min} \text{for (both end continuous)} = L/21 = 4.5/21 = 21.4 \text{cm}$$

$$h_{\min} \text{for (one end continuous)} = L/18.5 = 2.72/18.5 = 14.7 \text{cm}$$

Take h = 35 cm

4.4 Design of Topping

✓ Statically System For Topping:-

Consider the topping as strip of (1m) width, and span of mold length with both end fixed in the ribs.

V_u at distance d from support = 27 KN

Shear strength V_c , provided by concrete for the joists may be taken 10% greater than for beams. This is mainly due to the interaction between the slab and closely spaced ribs. (ACI, 8.13.8).

$$V_c = \frac{1.1}{6} \sqrt{f'_c} b_w d = \frac{1.1}{6} \sqrt{24} \times 120 \times 314 \times 10^{-3} = 33.84 \text{ KN}$$

$$f_c = 24 \text{ Mpa} \quad f_y = 420 \text{ Mpa}$$

(4.7.1) Check the slenderness effect:

(Non-sway system braced, $K=1$)

$$\left(\frac{M_1}{M_2}\right) = 1 \quad \text{braced frame with } M \text{ min}$$

$$\frac{kL_u}{r} < 34 - 12 \left(\frac{M_1}{M_2}\right) \leq 40$$

$$r_x = \sqrt{\frac{I}{A}} \approx 0.3h = 0.3 \times 0.5 = 0.15$$

$$r_y = \sqrt{\frac{I}{A}} \approx 0.3h = 0.3 \times 0.5 = 0.15$$

$$L_u = 5.0 \text{ m}$$

$$\frac{kL_u}{r_x} = \frac{1 * 5.0}{0.15} = 33 > (34 - 12) = 22$$

So the column is long at x axis

$$\frac{kL_u}{r_y} = \frac{1 * 5.0}{0.15} = 33 > (34 - 12) = 22$$

So the column is long at y axis

$$e_{\min} = (15+0.03h) = 15 + 0.03*500 = 30\text{mm}$$

$$E_c = 4700 \sqrt{24} = 23025 \text{ Mpa}$$

$$I_g = bh^3/12 = 5.2*10^9 \text{ mm}^2$$

$$B_{\text{dns}} = 1.2(1580)/((1.2*1580)+(1.6*270)) = 0.814$$

$$EI = \frac{0.4*23025*5.2}{1+0.814} = 26395 \text{ KN.m}^2\text{s}$$

$$P_c = \pi^2*26395/(1*5)^2 = 10400 \text{ KN}$$

$$C_m = 0.6+0.4(1) = 1$$

$$\delta_{\text{ns}} = 1/(1-(2328/(0.75*10400))) = 1.4$$

$$M_2 = M_{\min} = P_u * e_{\min} = 2328*0.03 = 69.84 \text{ KN.m}$$

$$M_c = \delta_{\text{ns}}*M_2 = 1.4*69.84 = 97.7 \text{ KN.m}$$

$$e = e_{\min} * \delta_{\text{ns}} = 42$$

$$e/h = 0.084$$

$$\phi \frac{p_n}{A_g} = \frac{P_u}{A_g} = 2328*1000*0.145/(500*500) = 1.35 \text{ ksi}$$

$$\rho = 0.0123$$

Check in Bresler equation:

$$P_{\text{ux}} = \frac{1.35*500*500}{0.145} * 10^{-3} = 2327.6$$

$$P_{\text{uo}} = \phi P_{\text{no}} = \phi A_g [0.85f'_c(1-\rho_g) + \rho_g f_y]$$

$$= 0.65*500*500[0.85*24(1-0.0123) + 0.0123*420] * 10^{-3} = 2246.7 \text{ KN}$$

Substituting P_{ux} , P_{uy} , P_{uo} in Bresler equation:

$$\frac{1}{\phi P_n} = \frac{1}{P_{ux}} + \frac{1}{P_{uy}} - \frac{1}{P_{uo}}$$

$$\frac{1}{\phi P_n} = \frac{1}{2327.6} + \frac{1}{2327.6} - \frac{1}{2246.7}$$

$\phi P_n = 2416 \text{ KN} > P_u = 2328 \text{ KN} \dots\dots\dots \text{OK.}$

$A_{st} = \rho * A_g = 0.031 * 500 * 500 = 7750 \text{ mm}^2$

Try 16 $\phi 25 = 7840 \text{ mm}^2 \dots\dots \text{OK}$

(4.7.2) Design the stirrups:

The spacing of ties shall not exceed the smallest of:

- $16 \times d_b = 16 \times 25 = 400 \text{ mm}$ control.
- $48 \times d_s = 48 \times 10 = 480 \text{ mm}$
- Least dimension of the column = 500 mm

Use $\phi 10 @ 200 \text{ mm}$.

Fig(4-14) :Column section and reinforcement

(4.7.3) Check for code requirements:

$$\text{clear spacing between longitudinal bars} = \frac{500 - 40 \times 2 - 10 \times 2 - 5 \times 25}{5} = 55 \text{ mm}$$

$$55 \text{ mm} > 40 \text{ mm}$$

$$> 1.5 d_b = 37.5 \text{ mm}$$

- gross reinforcement ratio = 0.031 $0.01 \leq 0.031 < 0.08$ ok
- NO of bars = 16 > 4 bars for square columns.
- min ties diameter: $\phi 10$ for $\phi 32$ longitudinal bars and smaller.

4.8 Design of Mat Foundation:

After we tried the isolated footings under all columns the relative area of the footing to the building area was more than 70% so we decided to use strip footing under the theater and mat footing for the rest of the building as detailed in the attached drawings

Procedure to design Mat Footing:

Basically, the design is done based on the following equation:

$$P = \sum_i P_i = P_1 + P_2 + \dots$$

$$q = \frac{P}{A} + \frac{M_x}{I_x} y + \frac{M_y}{I_y} x \leq q_{allow, net}$$

Where

A – area of the raft ($B \times L$)

I_x – moment of inertia of the raft about x –axis $I_x = \frac{BL^3}{12}$

I_y – moment of inertia of the raft about y –axis $I_y = \frac{LB^3}{12}$

M_x – moment of the applied loads about the x –axis, $M_x = Pe_y + M_{x(lateral\ load)}$

M_y – moment of the applied loads about the y –axis, $M_y = Pe_x + M_{y(lateral\ load)}$

Where e_x and e_y , are the eccentricities of the resultant from the center of gravity of the raft.

The coordinates of the eccentricities are given by:

$$X' = \frac{P_1x_1 + P_2x_2 + P_3x_3 + \dots}{P}, \quad Y' = \frac{P_1y_1 + P_2y_2 + P_3y_3 + \dots}{P}$$

Where x_1, x_2, \dots are the x – coordinates of P_1, P_2, \dots

$$e_x = X' - \frac{B}{2}$$

Where y_1, y_2, \dots are the y – coordinates of P_1, P_2, \dots

$$e_y = Y' - \frac{L}{2}$$

To draw the shear and moment diagrams we can divide the raft into several strips in the x -direction and in y -direction. The soil pressure at the center-line of the strip is assumed constant along the width of the strip.

Design each strip for shear and flexure as in the continuous footing design.

For the reinforcement details see the attached architectural drawings.

4.9 Design of stair:

Figure (4-19): Top view of stair

(4.9 .1) Determination of Slab Thickness:

$$L = 7.16\text{m.}$$

$$h_{\text{req}} = 7.16 / 20 = \mathbf{35.8}$$

⇒ **Use h = 40cm.**

$$\theta = \tan^{-1}(175 / 300) = 30.25$$

$$\text{Cos } \theta = 0.864$$

(4.9.2) Load Calculations at section :

- Load on Flight:

Dead Load:

For 1m strip:

$$\text{Flight} = (25*0.4)/(\text{Cos}30.25) = 11.57 \text{ KN/m.}$$

$$\text{Horizontal Mortar} = 0.03*22*1 = 0.66 \text{ KN/ m.}$$

$$\text{Plaster} = (0.02*22)/ (\text{Cos } 30.25) = 0.51 \text{ KN/ m.}$$

$$\text{Horizontal tiles} = 23*0.03 = 0.7 \text{ KN / m.}$$

$$\text{Vertical tiles} = 22*0.03*(17.5/30) = 0.38 \text{ KN/m}$$

$$\text{Triangle} = 25*0.175*1*0.5 = 2.16 \text{ KN/m}$$

$$\text{Total dead load} = 15.98 \text{ KN/ m.}$$

- Load on landing:

Dead Load:

$$\text{Tiles} = 0.03 * 23 * 1 = 0.69 \text{ KN/m.}$$

$$\text{Mortar} = 0.02 * 22 * 1 = 0.44 \text{ KN/ m.}$$

$$\text{Plaster} = 0.02 * 22 * 1 = 0.44 \text{ KN/ m.}$$

$$\text{Slab} = 0.4 * 25 * 1 = 10 \text{ KN/ m.}$$

$$\text{Sand} = 16 * 0.07 * 1 = 1.12 \text{ KN/m}$$

$$\text{Total dead load} = 12.69 \text{ KN/ m.}$$

Live load:

$$\text{Live load for stairs} = 5 \text{ KN/ m}^2.$$

Factor Loads:

$$W = 1.2 * 15.98 + 1.6 * 5 = 27.18 \text{ KN/ m}^2.$$

$$W = 1.2 * 12.69 + 1.6 * 5 = 23.23 \text{ KN/ m}^2.$$

(4.9.3) Design of Shear:

Assume $\emptyset 12$ for main reinforcement: -

$$\text{So, } d = 400 - 20 - 12 \sqrt{2} = 374 \text{ mm}$$

$$V_u = 60.5 - 11.615 * (0.15 + 0.374) = 54.42 \text{ KN.}$$

$$\phi V_c = \frac{\phi \sqrt{f_c'} * b_w * d}{6}$$

$$\phi V_c = \frac{0.75 * \sqrt{24} * 1000 * 374}{6} = 229.03 \text{ KN}$$

$$V_u = 54.42 \text{ KN} = 229.03 \text{ KN} \cdot \phi V_c <$$

No shear Reinforcement is required. So the depth of the stair is OK.

(4.9.4) Design of Bending Moment:

$$\text{Max Mu} = 60.5 * \left(\frac{6.4}{2}\right) - 11.62 * 1.7 * \left(\frac{1.7 + 3}{2}\right) - 27.18 * \frac{3}{2} * \frac{3}{4} = 116.60 \text{ KN.m.}$$

$$M_n = \frac{M_u}{0.9} = 129.5 \text{ KN.m/m}$$

Assume Ø 12 for main reinforcement: -

$$\text{So, } d = 400 - 20 - 12 \cdot 2 = 374 \text{ mm}$$

$$K_n = \frac{M_n}{b \cdot d^2}$$

$$K_n = \frac{129.5 * 10^6}{1000 * 374^2} = 0.95 \text{ MPa}$$

$$m = \frac{f_y}{0.85 * f_c'}$$

$$m = \frac{420}{0.85 * 24} = 20.6$$

$$\rho = \frac{1}{m} \left(1 - \sqrt{1 - \frac{2mK_n}{f_y}} \right) = \frac{1}{20.6} \left(1 - \sqrt{1 - \frac{2 * 20.6 * 0.95}{420}} \right) = 0.00232$$

$$A_{s_{req}} = 0.00232 * 1000 * 374 = 868 \text{ mm}^2$$

$$A_{s_{\min}} = 0.0018 * b * h = 0.0018 * 1000 * 40 = 720 \text{ mm}^2$$

$$A_{s_{\min}} = 720 \text{ mm}^2 \leq A_{s_{\text{req}}} = 868 \text{ mm}^2$$

Use $\Phi 12 @ 12.5 \text{ cm}$

$$A_s \text{ provided} = 904 \text{ mm}^2 > A_s \text{ req.}$$

Check Strain:

$$T=C$$

$$A_s * f_y = 0.85 * f'_c * b * a$$

$$420 * 904 = 0.85 * 24 * 1000 * a$$

$$a = 18.61 \text{ mm}$$

$$x = 21.89 \text{ mm}$$

$$\epsilon_s = 0.048 > 0.005$$

$$\text{So } \phi = 0.9$$

5 -Lateral reinforcement:

$$A_{s_{\min}} = 7.2 \text{ cm}^2$$

Use $\Phi 10 @ 10 \text{ cm}$

$$A_s = 7.9 \text{ cm}^2/\text{m}$$

(4.9.5) Design of landing:

$$\text{Mu max} = 38.1 \text{ KN.m}$$

(4.9.6) Design of Bending Moment:

$$M_u = 38.1 \text{ KN.m}$$

$$M_n = M_u / 0.9 = 38.1 / 0.9 = 42.28 \text{ KN.m.}$$

$$d = 374 \text{ mm.}$$

$$K_n = \frac{M_n}{b \cdot d^2}$$

$$k_n = \frac{42.28 * 10^6}{1000 * 374^2} = 3.02 \text{ MPa .}$$

$$m = \frac{f_y}{0.85 * f_c'}$$

$$m = \frac{420}{0.85 * 24} = 20.6$$

$$\rho = \frac{1}{m} \left(1 - \sqrt{1 - \frac{2mM_n}{f_y}} \right) = \frac{1}{20.6} \left(1 - \sqrt{1 - \frac{2 * 20.6 * 3.02}{420}} \right) = 0.0078$$

$$A_{s_{req}} = 0.0096 * 1000 * 374 = 2925 \text{ mm}^2$$

$$A_{s_{min}} = 0.0018 * b * h = 0.0018 * 100 * 40 = 720 \text{ mm}^2$$

$$A_{s_{min}} = 720 \text{ mm}^2 \leq A_{s_{req}} = 2925 \text{ mm}^2$$

Use $\Phi 16 \setminus 15 \text{ cm}$

$$A_s = 33 \text{ cm}^2 / \text{m}$$

Check Strain:

$$T=C$$

$$A_s * f_y = 0.85 * f_c' * b * a$$

$$420 \cdot 33 = 0.85 \cdot 24 \cdot 1000 \cdot a$$

$$a = 67.94 \text{ mm}$$

$$x = 79.93 \text{ mm}$$

$$\epsilon_s = 0.011 \geq 0.005$$

$$\text{So } \phi = 0.9$$
