RAMI DANDIS

## TARIQ AL-SADI

In accordance with the recommendations of the project supervisor, and the acceptance of all examining committee members, this project has been submitted to the Department of Civil and Architecture Engineering in the college of Engineering and Technology in partial fulfillment of the requirements of the department for the degree of Bachelor of Science in Engineering.

ينابيع العطاء الذين زر عوا في نفوسنا الطموح و المثابر ......

انهار المحبه التي لا تنضب.........أمهاتتا الاحبه

يحملون في نفوسهم ذكريات الطفولة والثباب....

الأهل والأصدقاء
....
من مهدو ا لنا طريق العلم والمعرفه.......

من ضحوا بحريتهم من اجل حريتنا.......

وصلت رائحة دمائهم الزكيه الى السماء النديه ......شهـاؤنا الابرار

## ACKNOWLEDGMENT

We would like to thank and gratitude to Allah, the most merciful who granted us the ability and willing to start the project.

We thank Palestine Polytechnic University, Department of civil and architecturalengineering and local public committee in each camp.

This project would not have been possible without the assistance of many individual. We are grateful to these people, who volunteered their time and volunteered their time and advice, Specially Eng. Samah AL-JAbari, and all of who help us to finish this project.

Finally, our deep sense and sincere thanks to our parents, brothers and sisters for all patience, and for their endless support and encouragement.

This graduation project has been supported by the deanship of graduate studies and scientific research through "Distinguished Graduation Project Fund"

After 1948 the Palestinians start a new stage of their life, About half of them immigrate to West Bank, Gaza Strip and all over the world to live in temporary Camp.

UNRWA "United Nation Relief and Work Agency" is the organization which works on rehousing the refugees and looking after their needs.
$25 \%$ of the Palestinian refugees live in West Bank distributed on 19 camps from Jenin in the north to Al-Fawwar in the south they live in bad conditions, high population density, environmental problems and absence of physical infrastructure.

In the present study an evaluation of the Palestinian camps is to be done through studying the environmental, cultural, economic, social and infrastructure characteristics of three camps Jenin in the north, Qalndia in the middle and ALArroub in the south, then choose the worst one to design and /or redesign the basic parts of the physical infrastructure.

Project team concern with AL-Arroub camp as the worst camp, it's located in south of WestCamp, 11 KM north of Hebron and It has an area 242 donums, its population is about 10444 in 2007 with 328 person/hac as population density. The most important part of physical infrastructure will be designed for this camp which are: wastewater
collection system, storm water drainage system and roads redesign. These parts of infrastructure reduce the environmental problems in the camp and make the life of the refugees better.

The results of the present study show that the Palestinian camps face an environmental problem caused by absence of physical infrastructure.

#### Abstract

\title{ Evaluation and Design of Infrastructure in the Palestinian Camp }

Case Study: AL-Arroub Camp

Project Team

ANAS OWEIW IBRAHIM AL-TWAYHA

MOHAMMED QUTTENEH RAMI DANDIS

## TARIQ AL-SADI

After 1948 the Palestinians start a new stage of their life, About half of them immigrate to West Bank, Gaza Strip and all over the world to live in temporary Camp.

UNRWA "United Nation Relief and Work Agency" is the organization which works on rehousing the refugees and looking after their needs.
$25 \%$ of the Palestinian refugees live in West Bank distributed on 19 camps from Jenin in the north to Al-Fawwar in the south they live in bad conditions, high population density, environmental problems and absence of physical infrastructure.

In the present study an evaluation of the Palestinian camps is to be done through studying the environmental, cultural, economic, social and infrastructure characteristics of three camps Jenin in the north, Qalndia in the middle and ALArroub in the south, them choose the worst one to design and /or redesign the basic parts of the physical infrastructure.

The results of the present study show that the Palestinian camps face an environmental problem caused by absence of physicalinfrastructure.

Project team concern with AL-Arroub camp as the worst camp and the most important part of physical infrastructure will be designed for this camp which are: wastewater collection system, storm water drainage system and roads redesign. These parts of infrastructure reduce the environmental problems in the camp and make the life of the refugees better.

## INTRODUCTION

1.1 GENERAL
1.2 PROBLEM DEFINITION
1.3 OBJECTIVES AND GOALS
1.4 PREVIOUS STUDY
1.5 METHODOLOGY
1.6 ORGANIZATION OF STUDY

## CHAPTER ONE

## Introduction

### 1.1 General:

Definition of camp according to UNRWA: the camp is a piece of land putting under the control of UNRWA by the host government for the aim of rehousing the refugees and establishing constructions for looking after their needs.

The appearance of the Palestinian refugee camps in general as a result of the tragedy of forced displacement suffered by a large part of the Palestinian people due to the catastrophe that befell him in 1948 after the Israeli movement to seize their lands.

Many Palestinians were expelled to the west bank and Gaza strip; therefore temporary camps were established for the refugee in preparation for their return, which was confirmed by a resolution the General Assembly of UN (194) on $11 \backslash 12 \backslash 1948$ and though it continued presence of refugees in places of refuge, and turned those places into permanent camps.

The Palestinians keep their communities on the degree of social cohesion and national identity. The misery for asylum in refugee camps became catalyst links to their land and the land of their fathers and grandfathers.

The association has turned into the camp to witness to the catastrophe and into the reluctance and resistance. As a result, the occupation forces clear the camps and resettlement away from the cities and the main streets and drove out many projects for that. Reference (al-farra and others, 1999).

Despite of misery and suffering the Palestinians lived for a long period of time in the camps and rejected the settlement and waive their legal rights and remained the legitimate right to return home. With these conditions, camps must be adequate to human live through good social services, educational services, and physical infrastructure services.

This study concern on the physical infrastructure in the west bank refugee camps, these camps contains $25 \%$ of the total of the refugees in Palestine and neighborhood countries, they are living in 19 refugee camps. In general the condition in these camps is so bad to human live.

That refugee shelters developed by the time from tents to civilization camps having many obstacles of population density, lack of water, lack of sewerage network, lake of solid waste management, environmental pollution, and invalid infrastructure.
This project doesn't mean that the refugees can't go back to their original land in near future if Allah will; on the contrary the goal here is to help refugees to live a decent life and support them until they return to their original homes.

### 1.1.1 Distribution of camps in the West Bank

The refugee camps in the west bank distributed (According to UNRWA) in 5 regions: Jerusalem, Nablus, Jericho, Hebron, and Bethlehem. Table 1.1 and figure 1.1 shows the names of these camps and how they distributed to Provinces in wWest Bank $\{1\}$.

Table 1.1: Distribution of camps in the West Bank. $\{1\}$

| Name Of Camp | Region | Province | Population | Area <br> (Donuum) |
| :--- | :---: | :---: | :---: | :---: |
| 1-Qalandia | Jerusalem | Jerusalem | 10759 | 253 |
| 2-Shuafat | Jerusalem | Jerusalem | 11170 | 198 |
| 3-Am'ari | Jerusalem | Ramallah | 10500 | 93 |

| 19-Al-Fawar | Hebron | Hebron | 8244 | 238 |

Figure 1.1: Distribution of the camps in West Bank. (Project Team)

### 1.1.2 Assets of residents of camps

The origin of the Palestinian camps turned into many Palestinian cities and villages can be shown in the following fig.

Figure (1.2): Assets of resident camps. \{1\}

### 1.2 Problem definition:

It was a new stage of life for the Palestinian after Al-Nakba in 1948, especially to the people whom migrate there lands and homes, they were about the half of the Palestinian people, and they were immigrate to all over the world and live in temporary camps and hopped to return quickly to their land and homes. By the time these people live in serious environment problems because there is no life facility and infrastructure, this shortage results is an unhealthy life.

When we talk about the refugee we should mention the UNRWA "United Nations Relief and Works Agency for Palestine Refugees" because it offered a huge helps to the refugees as foods, medic and temporary houses.

Because the team work can't study the camps outside the west bank we decided to make our study on the camps inside the west bank by chose three camps as sample to study, then we chose one camp as a case study to redesign the infrastructure facility to help the refugee to continue their life with the basic human needs and to help them to live in good environment.

### 1.3 Objectives and goals:

The very crowded area and high population density, without expanding in the boundary of the camp, and the absence of all infrastructure networks make these camps have serious environmental and infrastructure problems causes many healthy problems, and to reduce this problem project team want to make redesign for infrastructures of one of this camps according to analytical study.

The most important goal of the study is to analyze the environmental problem for refugee camps in west bank by studying the characteristics of environmental, cultural, economical, and social life in camps, and to determine the available health services and the problems that appear due to unavailable services to chose the worst camp to redesign its infrastructure facilities which consists of sanitary network, storm water drainage system, water network, and roads network. The project will include different items as follow:

1. Evaluate and provide a sanitary network to the camp:

This well be done by evaluate the ways that the refugees dispose of waste water and post up the problem caused by the most suitable sanitary network absence. Then study and design the sanitary network including all subsidiaries with proper inclination, connection to the main municipality lines, manholes, disposal methods, and design wastewater flow.
2. Provide storm water derange system:

This study will concentrate on the basics of storm water drainage which considered one of the most important services that camps need, and the study will show the options that can solve this problem, that camps have a special condition in their areas and roads.
3. Evaluate and design a road network.

Evaluate and design of the road geometry and arrangement of visual elements of the road, such as track, distance vision, inclinations and wide of the road, in addition to identifying the main design criteria to determine the compatibility by engineering design of the road with the requirements of the required engineering.

This work will be done to provide the resident of this camp the basic human right, taking in mind that camps have asocial condition in everything especially in location, areas, lands, roads, buildings and striping.

### 1.4 Previous Studies:

There are many studies talking about refugee camps in west bank from different sides including social, economic, population, healthy, educational, and architectural, but there's no studies talking about infrastructure side.

The studies were as follow:

1) the studies of researcher Dr.Abd Al-Rahman Almoghrabi in the title of" Social and economic situations in west bank camp" in April, 2004\{14\}:

According to statistics in 2003 the refugees were about third of the Palestinian people, this is a good reason to study there situations. Because there is no fair solutions for the refugee until this day make it complicated case especially because they are suffering from economic and social problems.

Studying there economic and social situation help them in their life and may help to end their suffering in diasporas camp.

People in West Bank camps basically depend on the facilities and services that UNRWA provide and supplied them, such as health centers , schools, some of infrastructure ...etc.

Poverty in Palestinian camps reaches to $32.8 \%$, which form $26.5 \%$ from the total of poor people in Palestine. This is one of the highest ratios in Palestine if it is compared with other communities, and high size of family which it up of 7.5 persons per family in average

This study talking about health, social, economic, educational, house situations, extreme poverty, and the infrastructure in general, finally it ends with recommendations to improve the social and economical situation in the camps.
2) The studies of researcher Faisal Radwan in the title of "Local public committee's efficiency in refugee services in social development in west bank camps", 2011\{13\}:

The goal of this study is to know the importance of local public committee in the camps and how the help the refugees, and the relationship with many variables as demographic distribution, gender, age groups, qualification, current place, social situations and people statistics. Rapid population growth in the camps without increasing the area of lands on which they live, resulting in to the negative impact on the buildings and residential units in terms of general appearance and health conditions (insulation and ventilation and air renewal), in addition to the negative effects what caused social problems, and reflected negatively "on a healthy population of the camp Physically and psychological".

According to questioner in this study the role of local public committee service is about $62.9 \%$, because theses committee are very active in political and national activities, and a little activities in social, health, and environmental sides.
3) The studies of Amal Taslak in the title of of "Architectural and planning characteristics for west bank camps (case study Jenin camp) ", 2006 \{12\}:

The study focuses on analyzing urban fabric in west bank camps and analyzing the architectural characteristics, services, public facilities, and roads networks through the stages urban development, with considering the social and cultural sides that help in forming this fabric.

Rehabilitation of the Palestinian refugee camps from the development projects of the services and public facilities and housing as a physical environment within the list of cities and communities without prejudice to the Palestinian right of return.

### 1.5 Methodology:

The project consists of four phases, which are designed to be completed in accordance with time schedule show in (table 1.2). The description of each of the five phases of the project and tasks involved are listed below:

Table 1.2: phases of the project with their expected duration

| Phase Number | Title | Duration |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 01/10 | 01/11 | 01/12 | 01/01 | 01/02 | 01/03 | 01/04 | 01/05 | 01/06 |
| First <br> phase | Data collection |  |  |  |  |  |  |  |  |  |
| Second phase | Field work, <br> Layout <br> preparation |  |  |  |  |  |  |  |  |  |
| Third phase | Estimation of waste water, storm water quantity. <br> And Traverse works |  |  |  |  |  |  |  |  |  |
| Forth phase | Infrastructure design and writing the report |  |  |  |  |  |  |  |  |  |

Infrastructure design means design of waste water network, storm water drainage system and road network.

### 1.5.1 First phase: Data collection

During this phase, available data and information were collected from different sources. Moreover, many site visits to the project area, the UNRWA offices and the local public committee were under taken. The first phase included the following activates:

1- Aerial photo and topographic maps for the area were collected.

2- Infrastructure for some of refugee camps were evaluated and studied.
3- Comparison between camps to choose the worst camp as a case study to design its infrastructure was made.
4- All needed maps from the aerial photo were prepared.

### 1.5.2 Second phase: Field works and layout preparation

A site visit to evaluate the contour maps and matching it with the actual ground elevation then preparing the layout for the three networks was made. The important tasks in this phase are:

1-Explore the site for the work to get a control point which are needed for the traverse measurements.

2- Field survey to measure the traverse, and make its correction by least square method.
3- Waste water network layout.
4- Storm water drainage system layout.
5-Road network.

### 1.5.3 Third phase: Estimation of Waste water and Storm water Quantities.

During third phase, available collection of hydrological data (temperature, wind speed, humidity, and rain fall intensity), and these phases were includes the following tasks:

1- Estimate the population density for study area.
2- Determination of waste water quantity.
3- Determination of storm water quantity.

### 1.5.4 Fourth phase: Infrastructure design and writing the report

During this phase the final design will in the last stage, and the project team prepared the specifications drawings, bill of quantities, preliminary maps.

### 1.6 Organization of the study:

The study report has been prepared in accordance with the objectives and goals of work.
The report consists of six chapters.

The first chapter entitled "Introduction" outlines the problem, project objectives, and phases of the project.

Chapter two entitled "Camps Evaluation" presents basic data and information about the camps.
Chapter three entitled "Characteristics of the Project Area" talk about the basic data on al-arroub camp. The topography, meteorological, Population data, water consumption, and wastewater production.

Chapter four entitled "Design Criteria" deals with the design criteria for water network, waste water collection network, storm water drainage system, and road network.

Chapter five "Analysis and Design" Define the area to be served by sewerage and Establish a system layout which includes the areas that are going to be served from waste water and storm water networks, existing streets and roads, show the estimation of quantities of waste water, storm water, traverse measurement and it's correction by several methods.

Chapter six entitled "Bill of quantities" deals with the item of the project estimated quantity of each item.

Chapter seven entitled "Conclusions and Recommendations".

## CHAPTER TWO

## CAMPS EVALUATION

2.1. GENERAL.
2.2. GENERAL INFORMATION.
2.3. DEMOGRAPHIC INFORMATION.
2.4. INFRASTRUCTUR SERVICES.

## CHPTER TWO

## CAMPS EVALUATION

### 2.1 GENERAL:

This chapter makes an evaluation between three camps Jenin in the north, Qalandia in the middle and Al-Arroub in south of west bank to compare between them then to choose the worst camp as a case study, this evaluation depending on many factors such as location, population, education, economic conditions, and infrastructure conditions, to make this evaluation easer the following topics will study for each camp : General information as geographic location, historical background, and area at present. Demographic information as population, education, health status, residential conditions and economic conditions. Infrastructure services such as municipal services, organization, programs, and activities.

## First: Jenin refugee camp

## A.2.2 General Information:

## A.2.2.1 Geographic location:

Jenin Refugee Camp lies in the north of West Bank, one km west of Jenin city, and it is surrounded by hills through Al Jedi valley (UNRWA). Figure (2.1) shows the location of Jenin refugee camp in Jenin city.

Figure (2.1): Location of Jenin camp, Project Team

## A.2.2.2 History of the camp:

Jenin camp was officially established in 1953 on 372 donums and administrated by UNRWA to shelter the Palestinian refugee after the disaster (ALNAKBA). In 1966 the area of the camp was about 472 donums but it reduced to about 372 donums in 1987 and in 2000 it stabled on about 473 donums.

Jenin camp is considered to be the third camp in Palestine in terms of area after Aqbat Jabr camp and Ein el-Sultan camp. The Palestinian was expelled by the Israeli force from their original land, Carmel in Haifa and the Carmel Mountains, up to Marj Bin Amer and Wadi Araba \{1\}. See figure (2.2).

Figure (2.2): Percentage of Jenin camp population according to places of origin \{1\}.

## A.2.2.3 Area at present:

Jenin camp is one of the biggest refugee camps in the west bank, but it's also suffering from the crowded area. According to UNRWA the current area of the camp is 473 donums.

## A.2.3 Demographic information:

## A.2.3.1 Population:

Based on UNRWA statistics at 2007 the number of refugees is about 15854 in Jenin's camp, in 3730 family's with an average individual 4.41 for each family, these families live in about 1478 shelter ( According to UNRWA ), and the population density in the camp is up to 348 person/hec.

Based on UNRWA statistics at 2007 the number of refugees is about 15854,8117 of the refugees are male about $51.2 \%$ and 7737 are female about $48.8 \%$.

The persons under 14 years are about $34.8 \%, 20.1 \%$ are between $15-24$ years, $36.4 \%$ are between 25-60, and $8.7 \%$ over 60 years, and figure (2.3) show the distribution .(UNRWA).

Chart (2.3): Age groups and the percentage of each group of the population in Jenin. \{1\}

## A.2.3.2 Education:

There are overcrowded students in Jenin camp's schools. UNRWA build two schools in the outskirts of the camp in addition to an old school inside the camp, these three schools attended by about 1460 boys and 1412 girls, so it's should work with two periods, morning period and afternoon period.

After reconstruction the camp - after Israeli attack in 2002 one school constructed in addition to the three schools, to decrease the overcrowded student in the schools, and the two period's school reduced to about $42 \%$, but there is a problem that these schools just for elementary stage and the students of the secondary stage should go to Jenin city.

There is shortage of facilities in schools of the camp, like laboratories, libraries ...etc. And there were huge effects of first and second "Intifada", Israeli occupation on literacy percentage, and phenomenon of schools drop-out increased; due to closing schools long periods, so the literacy percentage exceeds $33.4 \%$ of female older than 12 years, and $20.9 \%$ of male elder than 12 years, according to Palestinian Central Statistical Office (PCSO) $\{4\}$.

On the other side the percentage of who completed high education (secondary and above) reached $18.9 \%$ of females and $22 \%$ of males according to (PCSO) 2003, and according to field visits in 2005. We can't ignore the effect of occupation on level of academic fraud. The camp contains only one or two kindergartens.

The UNRWA tried to compensate the specified academic lost time by establishing new classes to help the students in their education by giving them books and providing them multi choices to help them in study.

## A.2.3.3 Health Status:

The UNRWA is the main provider of health services, by a health center that serves 5780 registered families; this center consists of several clinics, such as: Physician Clinic, Dental Clinic, also contains Medical Lab, and Physiotherapy Centre. $\{1\}$

The health sector in Jenin camp lacks health services available at night as the clinics are only open during the day. The camp is also without, various medical equipment, medicines and emergency services.

## A.2.3.4 Residential Conditions:

The number of housing units according to UNRWA records when establishment of the camp was equal 807 units, but in 2005 according to engineering department of the UNRWA it became 1350 housing units. $\{1\}$

The types of Housing Unit depending on construction materials according to Health Hazard Evaluation (HHE) of the UNRWA in 2007\{1\}:

- $0 \%$ is asbestos, wood, zinc.
- $1 \%$ is stone.
- $0 \%$ is concrete.
- $99 \%$ are load bearing hollow blocks.

Chart (2.4): Percentage of Housing Units in Jenin camp depending on building materials \{1\}

As for the number of floors in the camp according to Central Statistics Office (CSO) of UNRWA in 2007 , residential units which consists of ground floor it accounted $2 \%$ of housing units, $70 \%$ consists of First Floor, $15 \%$ consists of two floors, and $13 \%$ consists of more than two floors, See the following chart:

Chart (2.5): Percentage of Housing Units in Jenin depending on floors number \{1\}

## A.2.3.5 Economic conditions:

First stage: from 1953-1987

There is many factors effect on the camp on this stage of time, when Jenin camp established the refugee start works to feed their families and making live, they are work farmers in the camp or workers in Jenin city. But there still large number of unemployment people.

After 1967, some refugees were able to return to occupied territories to work there especially in Haifa and Khdera, and one of the reasons helped the refugees to work is the good relationship with the people in Jenin city and Haifa so that allowed them to work in small trades, other factor helped them is the migration of many refugee to the Jordan and the Gulf to funded their families. \{1\}.

Second stage: after 1987
The Israeli occupation prevent the refugees to work inside the occupied lands, so that affect the economic situation in Jenin camp, but in 1995 when the Palestinian Authority received the administration of Jenin camp the economic situation get better slowly until the second Intifada in 2000, during the Intifada the occupation prevent the people to work in the occupied territories and that led to more poverty between the refugee and increase the unemployment to about $70 \%$ of the total refugees.

And the invasion that happened in 2002 to the camp in the third of April make the situation worse because the camp was a main target to the Israeli attack to destroy the camp because the legendary resistance that the resident of camp show against the Israeli repression machine.
After these two distresses the camp adopted on the external helps from the UNRWA, in 2002 a study from Beer Zeit University showed that about 48\% of Refugees in Jenin camp are employees ,And this study mention that the unemployment inside the camp is about three times than out of the camp, so it reached about $33 \%$ according to the international bank in 2001 and that was a reason for increasing the unemployment inside the camp, and according to the office of the special coordinator of UNRWA in the occupied territories the unemployment reach to about $55 \%$ inside the $\operatorname{camp}\{1\}$.

## A.2.4 Infrastructure services:

The issue of infrastructure conditions in the west bank camps has not been discussed before, although it's one of the camps chronic problems. The purpose of this study is to discuss the complicated infrastructure conditions on samples of west bank camps.

## A.2.4.1 Municipal services:

The infrastructure networks in Jenin's camp are not good, because it is not designed on the engineering basics:

- Telecommunication: the shelters in the camps are connected to the communication network "PALTEL".
- Water Supply: all shelters in the camp have indoor water connection, and the average water available for person is 50 liters per day.
- Electricity: Nearly all the refugee has electricity in their houses, supplied by Jenin municipality.
- Sewage system: all of shelters in the camp are connected to public sewage network, supplied by Jenin municipality, but sewerage services in the camp are poor and rapidly deteriorated due to the absence of proper infrastructure elements, the constructed sewers systems are characterized by lack of long term planning, absence of proper municipal connections, the situation is usually treated on temporary basis, which cause health hazards.
- Storm water network: as well camps in west bank, jenen camp suffering from lack storm water drainage, the situation is resolved on partial solutions are given to chronic problems as flood of rain water in roads, ingress of water to homes, disrupt traffic in winter, and damage to students during departure and return from their schools .
-Road network:
The roads in this camp are three types:
Asphalt represents $10 \%$, unpaved represents $0 \%$, and concrete represents $90 \% .\{1\}$

## A.2.4.2 Organizations, Programs and Activities:

Like other camps Jenin camp administrated by UNRWA, which there is many services in refugee camp as:

One camp services office.
One boy's school and one girl's school.
One health center.
One food distribution Centre.
One youth center.
And there is a local public committee service responding on the activities that the UNRWA don't administrate.

Figure 2.6 represent Jenin camp layout. And figure 2.7 represent important site in Jenin camp.

A3 LAYOUT 2.6

A3 SITES 2.7

## Second: Qalandia Refugee camp

## B.2.2 General Information:

## B.2.2.1 Geographic location:

It is about 11 km to the north of Jerusalem in the top of mountain, its bounded by Khrbet Al ram from south, Kofor Akab from north, and the major road- that connect south with north of west bank- from west. $\{1\}$

Figure (2.8): Location of Qalandia camp \{1\}.

## B.2.2.2 History of the camp:

Qalandia refugee camp established in 1949 by United Nations Relief and Works Agency (UNRWA), the camp take its name related to Qalandia village in Jerusalem which the camp is established on.

The UNRWA rents the lands from the Hashemite Kingdom of Jordan in 1950 to cover about3000 refugees.

Original inhabitants came from 52 villages in the Al-Ludd, Ramleh, Haifa, Jerusalem and Hebron. See figure (2.9).

In 1965 many families were added to the Qalandia camp from the surrounding villages, and after 1967 war, several families immigrated from Emmaus and Latrun. But unfortunately there is about 170 families are not considered as refugees, but the difficult condition forced them to live in the camps.
The refugee life condition in 1948 was very difficult and they were live in tents, after that the UNRWA provided them small rooms $\left(11 M^{2}\right)$ for each family, high population density and small houses make the refugees to expand horizontally, and this cause's crowded camp.

Figure (2.9): Percentage of Qalandia camp population according to places of origin $\{1\}$.

## B.2.2.3 Area at present:

The area expanded with the time due to the population growth, but it still so small besides of huge population density. According to URWA Reports; the recent area is 253 donums.

## B.2.3 Demographic Information:

## B.2.3.1 Population:

Based on UNRWA statistic on the year of 2007, the number of refugees in Qalan dia is about 10759 refugees in 2430 family with average individual 4.6 for each family, these families live in about 870 shelters. \{1\}

The last population statics shows that about 5552 of the refugees are male about $51.6 \%$ and 5207 are female about $48.4 \%$.

The persons under 14 years are about $35.6 \%, 21.3 \%$ are between $15-24,37.0 \%$ between $25-60$ years and about $6.1 \%$ are over $60 .\{1\}$

Figure (2.10): Age groups and the percentage of each group of the population in Qalandia camp. $\{1\}$

## B.2.3.2 Education:

The educational attainment in Qalandia Refugee Camp According to last statistics in 2007 UNRWA, there are four schools in Qalandia camp two administrated by the UNRWA and the other are governmental school, there are about 856 students in two boys schools and about 915 students in girls school.

There are four schools in the present, for elementary stage there are three schools supervised by UNRWA, and there is just one secondary school supervised by government. The following table shows the number of schools by name, stage, gender, and supervising authority according to UNRWA.

The number of students in Qalandia refugee camp according to UNRWA services within refugee camps (2007) about 1771,856 are male were 310 studying elementary school and 546 in prep school ,and there are 915 female, were 361 studying in elementary school, and 476 studying in prep school.

## B.2.3.3 Health Status:

The UNRWA is the main provider of health services, there is a health center that serves about 1932registerd families, this center consists of several clinics, such as: Physician Clinic, and Dental Clinic, And also contains Medical Lab, and Physiotherapy Centre .There are also five private health centers in the camp and one physiotherapy unit. \{1\}

## B.2.3.4 Residential Conditions:

The number of housing units according to UNRWA records was 250 units when the camp established, but in 2005 according to UNRWA there are about 850 units. $\{1\}$
The types of housing units depending on construction materials according to Health Hazard Evaluation (HHE) of the UNRWA in 2007. \{1\}:
$1-0 \%$ is asbestos, wood, zinc.
$2-0 \%$ is concrete.
$3-10 \%$ is stone.
$4-90 \%$ is cement bricks.

Figure (2.11): Percentage of Housing Units in Qalandia camp depending on building materials $\{1\}$

As for the number of floors in the camp according to Central Statistics Office (CSO) of UNRWA in 2007 ,the residential units are consists of ground floor are about $10 \%$ of housing units, $50 \%$
consists of First Floor, 35\% consists of two floors, and 5\% consists of more than two floors , See the following chart.

Figure (2.12): Percentage of Housing Units in Qalandia depending on floors number. $\{1\}$

## B.2.3.5 Economic conditions:

The refugees in Qalandia camp in general are working in Israeli private sector and technical works.

1-99\% of refugees male work in Israeli private sectors.
$2-2 \%$ of female works in public sector and UNRWA.
Some refugees are working in small shops and minimarkets, and there is a shoes factory established by local public committee services to reduce the number of unemployment refugees.

## B.2.4 Infrastructure services:

Like other refugee camps the infrastructure networks in Qalandia is bad, because it is not designed on the engineering basics.

## B.2.4.1 Municipal Services:

Telecommunication: About $90 \%$ of the shelters in the camp are connected to the telecommunication network PAL-COM (Palestinian).

- Water: The water networks serve about $100 \%$ of the refugee but it is not sufficient because the lack of water especially in summer and the owner of distribution network is Jerusalem Water Undertaking JWU (Palestinian company).
- Electricity: The entire refugee has electricity in their houses and from Jerusalem District Electrical Company.
-Sewage system: there is public sewage network system covers most of the refugee camp, but still there are many houses have cesspits, sewage system is considerd not good, because the sewage network is not designed on engineering basics, built in uncontrolled way, and it is suffering from leaking out the pipes especially at connection points. Also the network closed some times because of solid wastes.
-Storm water system: there is no storm water drainage system in this camp so the roads flood in winter.
-Roads networks: the roads in this camp are three types
1- Paved roads $75 \%$.
2- Unpaved roads $5 \%$.
3- Concrete roads $20 \%$.
So it's reflected the bad situation in roads of qalandia camp.

## B.2.4.2 Organization, Program, Activities:

Like other camps Qalandia camp administrated by UNRWA, which there is many services in refugee camp as:

- One camp services office.
- Tow boy's school and tow girl's school.
- One health center.
- One physiotherapy Unit.
- One food distribution Centre.

And there is a local public committee service responding on the activities that the UNRWA don't administrate.
Figure 2.13 represent Qalandia camp layout. And figure 2.14 represent important site in it.

A3 Layout

2.14

## Third: Al-Arroub refugee camp

## C.2.2 General Information:

## C.2.2.1 Geographic location:

Al-Arroub refugee camp is located in the south of West Bank about 11 km north of Hebron and 15 km south of Bethlehem, on the main road between Bethlehem and Hebron, it is bordered from the east Beit Fajar, Israeli settlements from the north, Beit Ummar from the west, and from the south there is Sa'aer . $\{5\}$

Figure (2.15): Location of AL-Arroub camp (Project Team)

## C.2.2.2 History of camp:

Established in 1949 by the United Nations Relief and Works Agency (UNRWA), Al-Arroub Refugee Camp began as a place for Palestinian refugees after the Palestinian Catastrophe, 'Al Nakba', when they were forced to leave their original villages by the Israeli army. These refugees lived in Al-Arroub area on only 242 donums, UNRWA when established the camp build 807 housing units for them according to their family size. Since its establishment in 1949,
the camp remains supervised by UNRWA, which provides essential services and needs from health, education to humanitarian assistance.

Villages which they were expelled up to 33 villages located in the Ramleh, Hebron and Gaza such as: Iraq Almansheia, Zakaria, Ajor, Al-Qostanteniah Al-Faloja, Al-Dawayma, and Beit Ntef. And the figure (2.16) shows the proportion of the camp population from their original villages. $\{5\}$

Figure (2.16): Percentage of AL-Arroub camp population according to places of origin. $\{1\}$

For the legal status of land, all West Bank camps were set up on plots of land leased by UNRWA from the Hashemite Kingdom of Jordan in 14/03/1951. No lease agreement with private individuals. When camps were established, most of the land was already state land, while small private plots had been leased by the host government from local land owners, the area of the camp at a present time 242 donums, $77.43 \%$ is private land, and $22.4 \%$ government land.

## C.2.2.3 Area at present:

The area expanded with the time due to the huge population growth, but it still so small besides of huge population density and so crowded, also no current possibility to expand out the camp's borders. According to URWA reports; the recent area is 242 donums.

## C.2.3 Demographic Information:

## C.2.3.1 Population:

Based on UNRWA statistics at 2007, the total population of AL-Arroub camp was 10444 refugee distributed in 1358 family, The average family size was 5.8 for each family, these families living in 1420 housing units (including upper floors), Also the population density in the camp up to 328 person/hac . $\{5\}$

Demographic characteristics:
The last population statics in 2007 by (PCBS) shows that about 5316 of the refugees are male about $50.9 \%$ From the total population and 5128 are female about $49.1 \%$ from the total population, therefore the sex ratio in the camp was 104 male for every 100 female. \{4\}
The Age Groups in the AL-Arroub Camp classified by UNRWA as follows:
The persons under years are about $42.7 \%$ this percentage shows that the community in the ALArroub camp is a young society, $19.8 \%$ are between 15-24 years, $32.8 \%$ are Between 25-60 years, and $4.7 \%$ older than 60 years, and the following figure(2.17) shows that (UNRWA, 2008).

Figure (2.17): Age groups and the percentage of each group of the population in AL-Arroub camp. $\{1\}$

## C.2.3.2 Education:

The educational attainment by gender in Al 'Arroub Refugee Camp According to last statistics in 2007 by Palestinian Central Bureau of Statistics (PCBS), for the population aged over 10 years ,table (2.1) shows that $5.5 \%$ of the population were illiterate ,Where the percentage of male illiterate $26.4 \%$ and $73.6 \%$ of females. The table also shows that $10.8 \%$ from the people can read and write without formal education, $20 \%$ had completed the elementary stage, $29 \%$ had completed preparatory stage, $16.7 \%$ had completed secondary stage, $18 \%$ from residents of camp completed the higher education study (associate diploma and more). $\{5\}$

Table (2.1): Al 'Arroub Refugee Camp Population (10 years and above) by educational attainment by Gender. \{5\}

| $\begin{aligned} & 9 \\ & 0 \\ & 0 \\ & 0 \\ & \hline 1 \end{aligned}$ |  |  | 龱 |  |  |  |  | 果 |  | $\underset{\theta}{\theta}$ | - |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Male | 79 | 287 | 541 | 884 | 480 | 209 | 231 | 8 | 31 | 8 | 2758 |
| Female | 220 | 304 | 541 | 703 | 431 | 243 | 256 | 2 | 5 | 1 | 2706 |
| Total | 299 | 591 | 1082 | 1587 | 911 | 452 | 487 | 10 | 36 | 9 | 5464 |

There are four schools in the present, for the elementary stage there are three schools supervised by UNRWA, And secondary stage just it one supervised by government. The following table shows the number of schools by name, stage, gender, and supervising authority according to ARIJ field survey data, 2007.

Table (2.2): The schools in AL-Arroub refugee camp by name, stage, gender, and supervising authority. $\{5\}$

| NO. | School Name | Stage | Gender | Supervising <br> Authority |
| :---: | :---: | :---: | :---: | :---: |
| 1. | AL-Arroub Co-education <br> Agriculture Secondary School | Secondary | Co-education | Governmental |
| 2. | AL-Arroub Elementary Boys <br> School | Elementary | Male | UNRWA |
| 3. | First AL-Arroub Elementary <br> Girls School | Elementary | Female | UNRWA |
| 4. | Second AL-Arroub Elementary <br> Girls School | Elementary | Female | UNRWA |

The number of students in AL-Arroub refugee camp according to UNRWA services within refugee camps (2007) ,about 2100 students, 1043 are male ,whom 362 studying in second shift ,as female 1057, whom 581 studying in first school for girls, and 476 studying in second school for girls. $\{1\}$

## C.2.3.3 Health Status:

The UNRWA is the main provider of health services, By a health center that serves 2880 registered families in which, This center consists of several clinics, such as: Physician Clinic , and Dental Clinic, And also contains Medical Lab, and Physiotherapy Centre .

There are also two private clinics in the camp, General Medicine Clinic, and Dental Clinic, and there are also two pharmacies. $\{1\}$

The health sector in Al 'Arroub Camp lacks health services available at night as the clinics are only open during the day. The camp is also without an ambulance, various medical equipment, medicines and emergency services. Camp residents are forced to travel about two or twelve kilometers to reach Beit Fajar and Hebron health clinics and hospitals, respectively. \{5\}

## C.2.3.4 Residential Conditions:

The number of housing units according to UNRWA records when establishment of the camp was equal 807 units, but in 2005 according to engineering department of the UNRWA it became 1350 housing units. $\{1\}$

The types of Housing Units depending on construction materials according to Health Hazard Evaluation (HHE) of the UNRWA in 2007. \{1\}
$1-0 \%$ is asbestos, wood, zinc.
2-11.7\% are stone.
$3-0.5 \%$ is concrete.
4- $87.8 \%$ are cement bricks.

Figure (2.18): Percentage of Housing Units in AL_Arroub depending on building materials. $\{1\}$

As for the number of floors in the camp according to Central Statistics Office (CSO) of UNRWA in 2007 , residential units which consists of ground floor it accounted $15 \%$ of housing units, $50 \%$ consists of First Floor, $33 \%$ consists of two floors, and $2 \%$ consists of more than two floors, See figure (2.19).

Figure (2.19): Percentage of Housing Units IN AL_Arroub camp depending on floors number. $\{1\}$

## C.2.3.5 Economic Conditions:

The employment rate in AL-Arroub camp according to Palestinian Central Bureau of Statistics (PCBS) in 2007 is $80.4 \%$, whom $78 \%$ are male, and $22 \%$ are female. $\{4\}$
Most of the refugees are working as an employees, where this ratio up to $50 \%$ of the employment rate, while the rest are working in the private sector, Services Sector ,and in Israeli labor market .Figure (2.20) shows the percentage for each sector from employment sectors. \{5\}

Figure (2.20): Employment percentage for each sector from employment sectors in AL-Arroub camp by field survey conducted in the Camp $\{5\}$

## C.2.4 Infrastructure:

Like other refugee camps the infrastructure networks in Al-Arroub camp is very bad, because it is not designed on the engineering basics, and the camp were found on temporal basis waiting for the solution of refugee's problem. Accordingly, infrastructures which were not developed during the past years despite the increase in refugee's numbers and the development in social and economic conditions among refugees.

## C.2.4.1 Municipal Service:

- Telecommunication: About $90 \%$ of the shelters in the camps are connected to the communication network PALTEL.
- Water: The water supply pattern has been developed from distribution by water tanker to public water stand pipes then into household connections. The development was done by various uncoordinated efforts. It was based on temporary basis which did not consider the future demands of population. The water networks serve about $100 \%$ of the refugee but it is not sufficient because the lack of water especially in summer.
- Electricity: Nearly all the refugee has electricity in their houses and the public local committee dispread it after purchasing it from Israeli electricity distribution network.
- Sewage system: In 2002 a sewage network built in Al-Arroub, in the beginning UNRWA installed sewer lines in the major street of the camp and connected them to the main municipal line. Other sewer lines were connected to old lines and passed beside houses (UNRWA). The existing sewerage system is still working and serves some of the population. The disadvantages of this system is that the flooded manholes, and lack of long term planning, absence of proper municipal connections, the situation is usually treated on temporary basis, which cause health hazards.
- Storm water drainage system: there is no proper storm water drainage system in the camp; however, it's have one culvert exist in camp were its constructed to dispose of storm water into a near valley passing beside the camp, but it's not efficient, because it's considered small, comparing it with the quantity of rain water, so in rainy season the alleys and streets are usually flooded, and they become a source of potential hazards that endanger the near houses and public health.
- Road network: Al-Arroub has deteriorated roads, because it is not built on the engineering basics .Which it is suffer from improper slopes and lack of asphalt quantities...etc. the roads in this camp are three types.

1- Asphalt roads $10 \%$.
2 - Unpaved roads $0 \%$.
3 - Concrete roads $90 \%$.
So it's present the bad situation in roads of Al-Arroub camp.

## C.2.4.2 Organizations, Programs, Activities:

Like other camps Al-Arroub camp administrated by UNRWA, which there is many services in refugee camp as:

One camp services office.
One boy's school and one girl's school.
One health center.
One food distribution Centre.
One youth center.
And there is a local public committee service responding on the activities that the UNRWA don't administrate.

Figure 2.21 represent AL-Arroub camp layout. And figure 2.22 represent important site in ALArroub camp.

A3 layout 2.21

A3 site 2.22

The following table evaluates and compare between camps to choose the most needed infrastructure camp.

Table (2.3): comparison between camps. (Project Team)

| Names of Refugee camp <br> Comparing <br> Factors |  | AL-Arroub <br> Camp | Qalandia <br> Camp | Jenin camp |
| :---: | :---: | :---: | :---: | :---: |
| 1. General Information: |  |  |  |  |
| Year of | ablishment | 1949 | 1949 | 1953 |
| Area at | ent (dunum) | 242 | 253 | 423 |
| 2.Demographic profile: |  |  |  |  |
| UNRW <br> popul | istered camp at present | 10444 Persons | 10759 persons | 15854 persons |
| 3.Spatial/Physical information: |  |  |  |  |
| Numbers 0 | lding at present | 1420 units, Including upper floor | 870 units including upper floors | 1478 units ,including upper floors |
| Populat | ensity (c/ha) | 328 | 575.9 | 199.8 |
| 4.Technical infrastructures/services: |  |  |  |  |
| Water supplier |  | UNRWA water | Jerusalem Water Undertaking | Jenin <br> Municipality |
| Average water available per person |  | 75 1/day | 40 1/day | 50 1/day |
| Sewer <br> disposal <br> facilities | Cesspits Public sewage network private sewage connection | Yes Yes No | Yes Yes No | No yes (owner: Jenin Municipal) <br> No |
| Storm-water drainage |  | No | No | No |

After obtaining this information it's clear that all camps have a bad conditions such as : " living situation , widespread unemployment, poverty, high density population and low level of services provided, bad infrastructure conditions, like unequal availability of sewage networks , lack of storm water networks, and unpaved roads. And therefore all of these camps are in need of assistance and rehabilitation.

Qalandia camp is ruled out for political reasons, as a part of this camp is followed administratively for the Israeli hold and therefore researchers stumble on them to enter the region.

Jenin camp is ruled out because that a part of its infrastructure is better than others, as it has a sewage networks built after 2002 events.

So this study will concern on AL-Arroub camp and it will be work with redesigning the infrastructure of this camp.

## CHAPTER THREE

## CHARACTERISTICS OF THE PROJECT AREA "AL-ARROUB CAMP"

3.1 GENERAL.<br>3.2 PROJECT AREA.<br>3.3 METROLOGICAL DATA.<br>3.4 POPULATION.<br>3.5 WATER CONSUMPTION.<br>3.6 WASTEWATER QUANTITY<br>3.7 STORM WATER.<br>3.8 ROADS STATUS.

### 3.1 General

In this chapter, we will talk about the basic data on Al-arroub camp. Topography, meteorological, Population data, water consumption, and wastewater production.

(Figure 3.1) General View of AL-Arroub Camp (Nov.2011)

### 3.2 Project Area

Al-Arroub is a Palestinian refugee camp located in the southern West Bank along the HebronJerusalem road in the Hebron Governorate.

It is fifteen kilometers south of Bethlehem, thirty five kilometers south of Jerusalem, eleven kilometers north of Hebron, border it from east bait fjar, bait omar from west, aseon colonies from north, and Sa'aer village from south. (Figure 3.2) shows the camp's location. Total land area is 242 donums according to UNRWA. The elevation of the candidate site ranges from (700 to 890) meter above the sea level. $\{5\}$

Figure (3.2): Location map, (Project team)

### 3.3 Meteorological Data:

The hydrology of region depends basically on its climate, and secondarily on topography. Climate is largely dependent on geographical position of the earth surface, humidity, temperature, and wind. These factors are affecting on evaporation and transpiration. So this study will include needed data about these factors. The climate of Al-aroub camp wet and the same climate of surrounding area. The camp is part of Hebron district witch is raised about 875 meters above the sea level.

### 3.3.1 Rainfall:

The average annual rainfall at area reaches approximately 650 mm . Rainfall occurs between October and May while it rarely rains in the summer season these information are given in table (3.1)

Table (3.1): monthly rainfall in Al-Arroub camp, $\{6\}$

| Month | Jan. | Feb. | Mar. | Apr. | May. | Jun. | Jul. | Aug. | Sep. | Oct. | Nov. | Dec. |
| :--- | :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Total <br> Rainfall <br> $(\mathrm{mm})$ | 158 | 131 | 98 | 30 | 5 | 0 | 0 | 0 | 0 | 14 | 73 | 124 |

### 3.3.2 Temperature:

The temperature is characterized by winter; minimum temperature is recorded against the day of observation, and the maximum temperature against the previous day. The annual average maximum temperature values is ( $21.1 \mathbf{c}^{\circ}$ ) and the annual average minimum temperature values is (10.4 $\mathbf{c}^{\circ}$ ) are given in table (3.2).

Table (3.2): monthly Temperature in Al-Arroub camp, $\{6\}$

| Month | Jan. | Feb. | Mar. | Apr. | May. | Jun. | Jul. | Aug. | Sep. | Oct. | Nov. | Dec. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Mean Max. <br> Temp. $\left(\mathrm{c}^{\circ}\right)$ | 12.3 | 13.0 | 16.5 | 20.9 | 25.7 | 28.5 | 29.6 | 30.0 | 28.4 | 25.7 | 20.4 | 14.7 |
| Mean Min. <br> Temp. $\left.\mathrm{c}^{\circ}\right)$ | 4.4 | 4.8 | 6.3 | 8.1 | 12.3 | 14.7 | 15.9 | 16.2 | 14.4 | 12.1 | 9.6 | 6.4 |
| Mean <br> Temp. $\left.\mathrm{c}^{\circ}\right)$ | 8.4 | 8.9 | 11.4 | 14.5 | 19.0 | 21.6 | 22.8 | 23.1 | 21.4 | 18.9 | 15.0 | 10.6 |

### 3.3.3 Relative Humidity

Humidity is the ratio of the amount of water in the air at a give temperature to the maximum amount it could hold at that temperature, expressed as a percentage. The average annual relative humidity in the Al-Arroub camp is $67 \%$. The highest percentage is observed during winter is $78 \%$ are given in table (3.3)

Table (3.3): monthly mean relative humidity in al-Arroub camp, $\{6\}$

| Month | Jan. | Feb. | Mar. | Apr. | May. | Jun. | Jul. | Aug. | Sep. | Oct. | Nov. | Dec. |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Mean RH <br> $(\%)$ | 77 | 78 | 71 | 65 | 57 | 54 | 59 | 64 | 70 | 64 | 72 | 75 |

### 3.3.4 Wind:

Al-Arroub camp Exposed in summers to hot and dry north and northern-east winds coming from the Arabian Peninsula, and daily winds blowing in daytime from the Mediterranean toward the ground and the median mountainous area due to differences in air pressure between the ground and water that temper the temperature and increase the air humidity. While in winter the area is under the influence of reverse westerly winds coming from the Mediterranean.

The wind is to take a path that is not straight an example of wind is a twisty path through the woods. The mean annual wind speed in the Al-Arroub camp is $7.1(\mathrm{Km} / \mathrm{h})$. The highest percentage is observed $10.8(\mathrm{~km} / \mathrm{h})$ are given in table (3.4).
(Table 3.4): monthly mean wind speed in al-Arroub camp. \{6\}

| Month | Jan. | Feb. | Mar. | Apr. | May. | Jun. | Jul. | Aug. | Sep. | Oct. | Nov. | Dec. |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Mean <br> Wind <br> Speed <br> $(\mathrm{Km} / \mathrm{h})$ | 8.6 | 10.1 | 10.8 | 9.7 | 6.5 | 5 | 5 | 5.4 | 5 | 5.8 | 5.8 | 7.9 |

### 3.4 Population:

### 3.4.1 Population projection:

The base for the forecast is the 2007 population for Al-Arroub camp obtained from PCBS of 7822 parsons. The annual growth rates for the next nine years are also obtained from the PCPS and they are presented in (Table 3.5).
(Table 3.5) annual growth rate (Project Team)

| Year | Annual growth rate \% |
| :---: | :---: |
| 2008 | 3.35 |
| 2010 | 3.40 |
| 2012 | 3.40 |
| 2014 | 3.36 |
| 2016 | 3.28 |

To calculate the population at the end of the design period (year 2036), a geometric increase is assumed, represented by the following equation:

$$
\begin{equation*}
P=P_{0} *(1+r)^{n} \tag{3.1}
\end{equation*}
$$

Where:
$\mathrm{P}_{\mathrm{f}}$ : Future population.
$\mathrm{P}_{0}$ : Current population.
n: Design period.
r: Population growth.

### 3.4.2 Population Forecast for Al-Arroub camp

According to UNRWA in 2007, the population of Al-Arroub camp was approximately 10444 refugees distributed in 1358 family. The camp has approximately the same population density of
camps on west bank with $432(\mathrm{c} / \mathrm{ha}$ ), and annual average population growth of ( $3.35 \%$ ) from table 3.5.

Table 3.6 presents the population projection up to the design horizon of 2036. The data show that the population of Al-Arroub camp is estimated to be 27156 in year 2036.
(Table 3.6) Population Forecast for Al-Arroub camp (Project Team)

| Year | 2011 | 2015 | 2020 | 2025 | 2030 | 2036 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Population(capita) | 11915 | 13594 | 16029 | 18900 | 22285 | 27156 |

### 3.5 Water Consumption

### 3.5.1 Introduction:

Water demand in Al-Arroub camp, like other West Bank towns, is continuously increasing due to the increasing in population. The population of Al-Arroub camp is estimated about 11915 for year 2011 and 27156 for year 2036. The result of all this is obvious, the total water requirement is ever on the increase, and per capita water consumption is also on increase. Water consumption is not constant, yearly, monthly, weekly, daily and hourly variations in water consummations are observed. Certain dry years cause more consumption. In hot months water is consumed in drinking, bathing, and watering lawns and gardens. On holidays and weekends the water consumption may be high.

Even during day water use various with high use during morning hours and low use at night. Maximum daily demand or maximum daily consumption usually occurs during summer months. According to the water consumption data obtained from the UNRWA, the total water consumption for the Al-Arroub camp is approximately 809 cubic meters per day .the total water consumption per dounm equal 3.3 cubic meters per day. Average water available per person (75 1/c. day). $\{1\}$

### 3.5.2 Forecast water consumption:

The present average consumption of water for domestic use in Al-Arroub camp does not represent the present and actual demand of water. So, it is estimated the water consumption in Al-Arroub camp will dramatically increase during the next few years.

The forecast of the future water demand is made on the following assumptions:

1. Upgrading the existing water supply system.
2. Present annual demand is $751 / \mathrm{c}$. d, and the rate of increase in the annual water demand per capita is equal to $2 \%$.
3. Present population is 11915 , and population growth rate is equal $3.35 \%$.
4. Design period equal 25 years, up to 2036.

Based on the above assumptions, the water consumption of Al-Arroub camp were estimated at years 2015, 2020, and 2025 and 2036 per capita for the same years were calculated. Is presented in Table 3.7:
(Table 3.7) water consumption Forecast in Al-Arroub camp (Project Team)

| Year | Population | Water Demand (L/day) |  |
| :---: | :---: | :---: | :---: |
|  |  | Per Capita | Total |
| 2007 | 10444 | 75 | 873300 |
| 2015 | 13594 | 87 | 1182678 |
| 2025 | 18900 | 102 | 1973160 |
| 2036 | 27156 | 119 | 3459674.4 |

### 3.6 Wastewater Quantity:

Sanitary sewage is mostly the spent water of the community draining into the sewer system. It has been observed that a small portion of spent water is lost in evaporation, seepage in ground, leakage, etc. Usually $80 \%$ of the water supply may be expected to reach the sewers.

In overall the amount of Domestic wastewater produced per capita per day is usually $80 \%$ of water consumption. Al-arroub doesn't produced industrial wastewater quantity because alarroub don't has industrial zones

(Figure 3.3) Wastewater manholes with very short distance.

Figure 3.3 Illustrate how much the distance between manholes is short, which mean that the wastewater network does not designed on an engineering standards.

(Figure 3.4) Infiltration of rainfall to wastewater network.
Figure (3.4) illustrate the infiltration of rainfall to wastewater which causes an increasing of quantity of water and produce an additional load to the wastewater network.

### 3.7 Storm Water

There is no proper storm water drainage system in the camp; however, it's have one culverts exist in camp were constructed to dispose of storm water into a near valley passing in the camp, but it's not efficient, because it's considered small with compared of quantity of rain water, so in rainy seasons the alleys and streets are usually flooded, and they become a source of potential hazards that endanger the near houses and public health.

(Figure 3.5) A Culvert crossing the camp in left image, and the way where it cross "beside the wastewater" in right image

(Figure 3.6) Accumulative of Water at culvert.

The Figure represent, the ditches considered not efficient, because it is small with compared of quantity of rain water, so in rainy seasons the streets are usually flooded as show, and they become a source of potential hazards that endanger the near houses and public health.

### 3.8 ROADS STATUS.

Al-Arroub has deteriorated roads, because it is not built on the engineering basis, and its show on picture

(Figure 3.7) Improper of road slopes, and asphalt cracks
The slopes in Al-Arroub roads are improper and the asphalt is cracks.

## Chapter Four

## Design Parameters

### 4.1 WASTEWATER COLLECTION SYSTEM DESIGN

### 4.1.1 General

Once used for its intended purposes, the water supply of a community is considered to be wastewater. The individual conduits used to collect and transport wastewater to the treatment facilities or to the point of disposal are called sewers.

There are three types of sewers: sanitary, storm, and combined. Sanitary sewers are designed to carry wastewater from residential, commercial, and industrial areas, and a certain amount of infiltration /inflow that may enter the system due to deteriorated conditions of sewers and manholes. Storm sewers are exclusively designed to carry the storm water. Combined sewers are designed to carry both the sanitary and the storm flows.

The network of sewers used to collect wastewater from a community is known as wastewater collection system. The purpose of this chapter is to define the types of sewers used in the collection systems, types of wastewater collection systems that are used, the appurtenances used in conjunction with sewers, the flow in sewers, the design of sewers, and the construction and maintenance of sewers.

### 4.1.2 Municipal Sewerage System

## Types Of Sewers:

The types and sizes of sewers used in municipal collection system will vary with size of the collection system and the location of the wastewater treatment facilities. The municipal or the community sewerage system consists of (1) building sewers (also called house connections), (2) laterals or branch sewers, (3) main and submain sewers, (4) trunk sewers.

House sewers connect the building plumbing to the laterals or to any other sewer lines mentioned above. Laterals or branch sewers convey the wastewater to the main sewers. Several main sewers connect to the trunk sewers that convey the wastewater to large intercepting sewers or the treatment plant.

The diameter of a sewer line is generally determined from the peak flow that the line must carry and the local sewer regulations, concerning the minimum sizes of the laterals and house connections. The minimum size recommended for gravity sewer is 200 mm (8 in).

## Sewer Materials:

Sewers are made from concrete, reinforced concrete, vitrified clay, asbestos cement, brick masonry, cast iron, ductile iron, corrugated steel, sheet steel, and plastic or polyvinyl chloride or ultra polyuinyl chloride. Concrete and ultra polyvinyl chlorides are the most common materials for sewer construction.

### 4.1.3 Types Of Wastewater Collection Systems

## Gravity Sewer System:

Collecting both wastewater and storm water in one conduit (combined system) or in separate conduits (separate system). In this system, the sewers are partially filled. A typical characteristic is that the gradients of the sewers must be sufficient to create self-cleansing velocities for the transportation of sediment. These velocities are 0.6 to $0.7 \mathrm{~m} / \mathrm{s}$ minimum when sewers are flowing full or half-full. Manholes are provided at regular intervals for the cleaning of sewers.

## Pressure Type System:

Collecting wastewater only. The system, which is entirely kept under pressure, can be compared with a water distribution system. Sewage from an individual house connection, which is collected in manhole on the site of the premises, is pumped into the pressure system. There are no requirements with regard to the gradients of the sewers.

## Vacuum Type System:

Collecting wastewater only in an airtight system. A vacuum of 5-7 m is maintained in the system for the collection and transportation of the wastewater. There is no special requirement for the gradients of the sewers.

Pressure and vacuum-types systems require a comparatively high degree of mechanization, automation and skilled manpower. They are often more economical than gravity system, when applied in low population density and unstable soil conditions. Piping with flexible joints has to be used in areas with expansive soils.

### 4.1.4 Sewer Appurtenances

## Manholes:

Manholes should be of durable structure, provide easy access to the sewers for maintenance, and cause minimum interference to the sewage flow. Manholes should be located at the start and at the end of the line, at the intersections of sewers, at changes in grade, size and alignment except in curved sewers, and at intervals of 4060 m in straight lines.

The general shapes of the manholes are square, rectangular or circular in plan, the latter is common. Manholes for small sewers are generally 1.0-1.2 m in diameter. For larger sewers larger manhole bases are provided. The maximum spacing of manholes is $40-60 \mathrm{~m}$ depending on the size of sewer and available size of sewer cleaning equipment $\{9\}$.

Standard manholes consist of base, risers, top, frame and cover, manhole benching, and step-iron. The construction materials of the manholes are usually precast concrete sections, cast in place concrete or brick. Frame and cover usually made of cast iron and they should have adequate strength and weight.

## Drop Manholes:

A drop manhole is used where an incoming sewer, generally a lateral, enters the manhole at a point more than about 0.6 m above the outgoing sewer. The drop pipe
permits workmen to enter the manhole without fear of being wetted, avoid the splashing of sewage and corrosion of manhole bottom .

## House Connections:

The house sewers are generally $10-15 \mathrm{~cm}$ in diameter and constructed on a slope of $2 \% \mathrm{~m} / \mathrm{m}$. house connections are also called, service laterals, or service connections. Service connections are generally provided in the municipal sewers during construction. While the sewer line is under construction, the connections are conveniently located in the form of wyes or tees, and plugged tightly until service connections are made. In deep sewers, a vertical pipe encased in concrete is provided for house connections.

## Inverted Siphons

An inverted siphon is a section of sewer, which is dropped below the hydraulic grade line in order to avoid an obstacle such as a railway or highway cut, a subway, or a stream. Such sewers will flow full and will be under some pressure; hence they must be designed to resist low internal pressures as well as external loads. It is also important that the velocity be kept relatively high (at least $0.9 \mathrm{~m} / \mathrm{s}$ ) to prevent deposition of solids in locations, which would be very difficult or impossible to clean.

Since sewage flow is subject to large variation, a single pipe will not serve adequately in this application. If it is small enough to maintain a velocity of $0.9 \mathrm{~m} / \mathrm{s}$ at minimum flow, the velocity at peak flow will produce very high head losses and may actually damage the pipe. Inverted siphons normally include multiple pipes and an entrance structure designed to divide the flow among them so that the velocity in those pipes in use will be adequate to prevent deposition of solids $\{2\}$.

### 4.1.5 Design Parameters

## Flow Rate Projections:

The total wastewater flow in sanitary sewers for industrial area is made up of two components:
(1) Domestic
(2) Infiltration.

Sanitary sewers are designed for peak flows from domestic, and peak infiltration allowance for the entire service area. The flow rate projections are necessary to determine the required capacities of sanitary sewers.

- The peak coefficient

In general, this coefficient increases when the average flow decrease, it will be determined from the practice and experience of the designer. The following relation has been used commonly by the designer and gives satisfactory results:

$$
\begin{equation*}
\operatorname{Pf}=1.5+2.5 / \sqrt{ } \mathrm{q} \tag{4.1}
\end{equation*}
$$

Where, q (in $1 / \mathrm{s}$ ) is the daily average flow rate of the network branch under consideration and Pf is the peak factor.

## Hydraulic Design:

As mentioned earlier and according to usual practice, the sewers will be designed for gravity flow using Manning's formula:

$$
\begin{equation*}
V=(1 / n) R^{2 / 3} S^{1 / 2} \tag{4.2}
\end{equation*}
$$

Depending on pipe materials, the typical values of n is 0.015

1. Minimum and Maximum Velocities

To prevent the settlement of solid matter in the sewer, the literature suggested that the minimum velocity at half or full depth - during the peak flow period should not be less than $0.6 \mathrm{~m} / \mathrm{s}$, Usually, maximum sewer velocities are limited to about $3 \mathrm{~m} / \mathrm{s}$ in order to limit abrasion and avoid damages which may occur to the sewers and manholes due to high velocities.
2. Pipes and Sewers

Experience indicates a minimum diameter of $200 \mathrm{~mm}(8 \mathrm{in})$ for sewer pipes. For house connections.

Pipe Materials: Different pipe materials may be recommended for the sewers. Polyvinyl chloride, vitrified clay or polyethylene material for small size pipes (approximately up to the size 400 mm in diameter).

Centrifugal cast reinforced concrete pipes may be used for larger diameter.
3. Manholes and Covers

Manholes should be located at changes in size, slope direction or junction with secondary sewer. Manholes spacing generally does not exceed 60 m .
4. Sewer Slope

For a circular sewer pipe, the slope must be between the minimum and maximum slope, the minimum and maximum slope is determined from minimum and maximum velocity. Generally the natural ground slope is used because it is the technical and economic solution, the solution is therefore recommended.
5. Depth of Sewer Pipe

The depth of sewers is generally 1.5 m below the ground surface. Depth should be enough to receive the sewage by gravity, avoid excessive traffic loads, and avoid the freezing of the sewer. It is recommended that the top of sewer should not be less than 1.5 m below basement floor $\{9\}$.

## Important Numbers:

- Maximum velocity $=3 \mathrm{~m} / \mathrm{s}$
- Minimum velocity $=0.6 \mathrm{~m} / \mathrm{s}$
- Maximum slope $=15 \%$
- Minimum slope $=0.5 \%$
- $\mathrm{H} / \mathrm{D}=70 \%$
- Minimum diameter 200 mm
- Minimum cover 1.5 m
- Maximum cover 5 m

### 4.2 STORM DRAINAGE SYSTEM DESIGN

### 4.2.1 General :

Rapid effective removal of storm runoff was a luxury not found in many cities in the early nineteenth century. Today, the modern city dweller has come to think of this as an essential service. Urban drainage facilities have progressed from crude ditches and stepping stones to the present intricate coordinates systems of curbs, gutters, inlets, and underground conveyance.

The design must consider meteorological factors, geomorphologic factors, and the economic value of the land, as well as human value considerations such as aesthetic and public safety aspects of the design. The design of storm water detention basins should also consider the possible effects of inadequate maintenance of the facility

### 4.2.2 Storm Water Runoff:

Storm water runoff is that portion of precipitation which flows over the ground surface during and a short time after a storm. The dependence parameters that controlled the quantity of the storm water which carried by a storm or combined sewer are the surface of the drainage area ( $\mathrm{A}, \mathrm{ha}$ ), the intensity of the rainfall ( i , $1 /$ s.ha), and runoff coefficient $C$ dimensionless (the condition of the surface). There are many methods and formulas to determine the storm flow, and in all of them above parameters show up. One of the most common methods is Rational method which will be discussed below.

## Rational Method:

The rational method has probably been the most popular method for designing storm systems. It has been applied all over the world and runoff is related to rainfall intensity by the formula,

$$
\begin{equation*}
Q=C . i . A \tag{4.3}
\end{equation*}
$$

Where :
$\mathrm{Q}=$ peak runoff rate ( $1 / \mathrm{sec}$ )
C = runoff coefficient, which is actually the ratio of the peak runoff rate to the average rainfall for a period known as the time of concentration.
$\mathrm{i}=$ average rainfall intensity, $\mathrm{mm} / \mathrm{min}$, for period equal to the time of concentration $A=$ drainage area, hectar.

For small catchments areas, it continues to be a reasonable method, provided that it is used properly and that results and design concepts are assessed for reasonableness. This procedure is suitable for small systems where the establishment of a computer model is not warranted.

The steps in the rational method calculation procedure are summarised below:

1. The drainage area is first subdivided into sub-areas with homogeneous land use according to the existing or planned development.
2. For each sub-area, estimate the runoff coefficient $C$ and the corresponding area $A$.
3. The layout of the drainage system is then drawn according to the topography, the existing or planned streets and roads and local design practices.
4. Inlet points are then defined according to the detail of design considerations. For main drains, for example, the outlets of the earlier mentioned homogeneous subareas should serve as the inlet nodes. On the other hand in very detailed calculations, all the inlet points should be defined according to local design practices.
5. After the inlet points have been chosen, the designer must specify the drainage subarea for each inlet point A and the corresponding mean runoff coefficient $C$. If the sub-area for a given inlet has non-homogeneous land use, a weighted coefficient may be estimated.
6. The runoff calculations are then done by means of the general rational method equations for each inlet point, proceeding from the upper parts of the watershed to the final outlet. The peak runoff, which is calculated at each point, is then used to determine the size of the downstream trunk drain using a hydraulic formula for pipes flowing full.
7. After the preliminary minor system is designed and checked for its interaction with the major system, reviews are made of alternatives, hydrological assumptions are
verified, new computations are made, and final data obtained on street grades and elevations. The engineer then should proceed with final hydraulic design of the system.

## Runoff Coefficient, C:

Runoff coefficient is a function of infiltration capacity, interception by vegetation, depression storage, and evapotranspiration. It is requires greatest exercise of judgment by engineer and assumed constant, actually variable with time. It is desirable to develop composite runoff coefficient (weighted average) for each drainage area as:

$$
\begin{equation*}
C=\frac{\sum C i . A i}{\sum A i} \tag{4.4}
\end{equation*}
$$

Where :
$\mathrm{Ai}=\mathrm{i}$ th area.
$\mathrm{Ci}=\mathrm{i}$ th runoff coefficient.

The range of coefficients with respect to general character of the area is given in the following tables (Table 4.1and Table 4.2).

Table 4.1: The Range of Coefficient With Respect to General Character of the Area $\{8\}$

| Description of Area |  | Runoff Coefficients |
| :---: | :---: | :---: |
| Business |  |  |
| Down town | Residential |  |
| Neighborhood | 0.70 to 0.95 |  |
|  |  | 0.50 to 0.70 |
| Single-Family | 0.30 to 0.50 |  |
| Multi-unit, detached | 0.40 to 0.60 |  |
| Multi-unit, attached | 0.60 to 0.75 |  |
| Residential (suburban) | 0.25 to 0.40 |  |
| Apartment | 0.50 to 0.70 |  |

| Industrial |  |
| :---: | :---: |
| Light | 0.50 to 0.80 |
| Heavy | 0.60 to 0.90 |
| Parks, Cemeteries | 0.10 to 0.25 |
| Playground | 0.20 to 0.35 |
| Railroad yard | 0.20 to 0.35 |
| Unimproved | 0.10 to 0.30 |

Table 4.2: The Range of Coefficient With Respect to Surface Type of the Area $\{8\}$

| Character of Surface |  | Runoff Coefficients |
| :---: | :--- | :--- |
| Pavement |  |  |
| Asphalt and concrete |  | 0.70 to 0.95 |
| Brick |  | 0.70 to 0.85 |
| Lawns, Sandy soil |  |  |
| Flat, 2 percent |  | 0.05 to 0.10 |
| Average,2to7percent |  | 0.10 to 0.15 |
| Steep, 7 percent |  | 0.15 to 0.20 |
| Roofs |  | 0.75 to 0.95 |
| Flat, 2 percent |  | 0.13 to 0.17 |
| Average,2 to 7percent |  | 0.18 to 0.22 |
| Steep, 7 percent |  | 0.25 to 0.35 |

## Rainfall Intensity, i:

In determining rainfall intensity for use in rational formula it must be recognized that the shorter the duration, the greater the expected average intensity will be. The critical duration of rainfall will be that which produces maximum runoff and this will be that which is sufficient to produce flow from the entire drainage area. Shorter periods will
provide lower flows since the total area is not involved and longer periods will produce lower average intensities. The storm sewer designer thus requires some relationship between duration and expected intensity. Intensities vary from place to another and curves or equations are specified for the areas for which they were developed.

The rainfall intensity depends on many factors through which we can do our calculations; we can list these factors as follow:

1. Average frequency of occurrence of storm $(1 / n)$ or (f).

Average frequency of occurrence is the frequency with which a given event is equaled or exceeded on the average, once in a period of years. Probability of occurrence, which is the reciprocal of frequency, ( n ) is preferred by sum engineers. Thus, if the frequency of a rain once a 5 -year ( $1 / \mathrm{n}=5$ ), then probability of occurrence $\mathrm{n}=0.20$. Selection of storm design rain frequency based on cost-benefit analysis or experience. There is range of frequency of often used:
a. Residential area: $\mathrm{f}=2$ to 10 years ( 5 year most common).
b. Commercial and high value districts: $\mathrm{f}=10$ to 50 ( 15 year common).
c. Flood protection: $\mathrm{f}=50$ year.
2. Intensity, duration and frequency characteristics of rainfall.

Basic data derived from gage measurement of rainfall (Point rainfall) over a long period can be used to obtain a rainfall height diagram that show the relation between the height of rain (mm) and time (min). The slope of the curve or rain height per unit time is defined as rain intensity:

$$
\mathrm{i}=\left(\begin{array}{ll}
\text { height of rain / time }
\end{array}\left[\frac{\mathrm{mm}}{\mathrm{~min}}\right]\right.
$$

The rain intensity in liter per second . hectare is equal:

$$
i\left(\frac{l}{s . h a}\right)=166.7 i\left[\frac{\mathrm{~mm}}{\mathrm{~min}}\right]
$$

in order to drive intensity-duration-frequency curves long-term observation of rainfall is needed. Analysis of such observation is given in any text in sanitary engineering.

## 3- Time of Concentration

The time of concentration is the time required for the runoff to become established and flow from the most remote part (in time) of the drainage area to the point under design.

$$
\begin{equation*}
t_{c}=t_{i}+t_{f} \tag{4.5}
\end{equation*}
$$

Where $t_{c}$ : time of concentration.
$\mathrm{t}_{\mathrm{i}}$ : inlet time.
$\mathrm{t}_{\mathrm{f}}$ : flow time.
Time of flow in storm, $\mathrm{t}_{\mathrm{f}}=\frac{\text { Length of pipe line }(\mathrm{L})}{\text { Velocity of flow }(\mathrm{v})}$

Inlet time $\left(\mathrm{t}_{\mathrm{i}}\right)$ : is the time required for water to flow over ground surface and along gutters to drainage inlet. Inlet time is function of rainfall intensity, surface slope, surface roughness, flow distance, and infiltration capacity and depression storage.

### 4.2.3 Hydraulic Consideration

## Introduction:

storm water usually designed as open channels except where lift stations of the flows, and the fact that an unconfined or free surface exists. The driving are required to overcome topographic barriers. The hydraulic problems associated with these flows are complicated in some cases by the quality of the fluid, the highly variable nature force for open-channel flow and sewer flow is gravity. For the hydraulic calculations of sewers, it is usually assumed uniform flow in which the velocity of flow is constant, and steady flow condition in which the rate discharge at any point of a sewer remains constant $\{10\}$.

## Hydraulic design equations:

In principle all open channel flow formulas can be used in hydraulic design of sewer pipes. The following are the most important formulas:

1. Chezy's formula:

$$
\begin{equation*}
V=C \sqrt{R S} \tag{4.6}
\end{equation*}
$$

Where V: the velocity of flow ( $\mathrm{m} / \mathrm{s}$ ).
C: the Chezy coefficient; $C=\frac{100 \sqrt{R}}{m+\sqrt{R}}$.

Where:
$\mathrm{m}=0.35$ for concrete pipe or 0.25 for vitrified clay pipe

R : the hydraulic radius (m)
S: the slope of the sewer pipe $(\mathrm{m} / \mathrm{m})$.
2. Darcy-Weisbach formula: It is not widely used in wastewater collection design and evaluation because a trial and error solution is required to determine pipe size for a given flow and head loss, since the friction factor is based on the relative roughness which involves the pipe diameter, making it complicated. DarcyWeishbach formula states that

$$
\begin{equation*}
H=\lambda \frac{L \times V^{2}}{D \times 2 g} \tag{4.7}
\end{equation*}
$$

Where H : the pressure head loss ( mwc ).
L: the length of pipe (m).
D: the diameter of pipe (m)
$\lambda$ : the dimensionless friction factor generally varying between 0.02 to 0.075 .
3. The Manning formula: Manning's formula, though generally used for gravity conduits like open channel, it is also applicable to turbulent flow in pressure
conduits and yields good results, provided the roughness coefficient n is accurately estimated. Velocity, according to Manning's equation is given by:

$$
\begin{equation*}
V=(1 / n) R^{2 / 3} S^{1 / 2} \tag{4.8}
\end{equation*}
$$

Where:
n : the Manning's roughness coefficient $\left[1 / \mathrm{n}\left(\mathrm{k}_{\mathrm{str}}\right)=75 \mathrm{~m} / \mathrm{s}^{1 / 3}\right]$.
$R$ : the hydraulic radius $=$ area $/$ wetted perimeter $(\mathrm{R}=\mathrm{A} / \mathrm{P})$

- For circular pipe flowing full, $\mathrm{R}=(\mathrm{D} / 4)$.
- For open channel flowing full, $R=\left[\left(b^{*} d\right) /(b+2 d)\right]$.

The Manning's roughness coefficient depends on the material and age of the conduit. Commonly used values of n for different materials are given in Table (4.3).

Table 4.3 Common Values of Roughness Coefficient Used in the Manning Equation $\{8\}$

| Material | Commonly Used Values of $\mathbf{n}$ |
| :---: | :---: |
| Concrete | 0.013 and 0.015 |
| Vitrified clay | 0.013 and 0.015 |
| Cast iron | 0.013 and 0.015 |
| Brick | 0.015 and 0.017 |
| Corrugated metal pipe | 0.022 and 0.025 |
| Asbestos cement | 0.013 and 0.015 |
| Earthen channels | 0.025 and 0.003 |
| PVC | 0.011 |

## Hydraulics of Partially Field Section:

The filling rate of a sewer is an important consideration, as sewers are seldom running full, so storm water sewers designed for $70 \%$ running full, that is means only $70 \%$ of the pipe capacity should be utilized to carry the peak flow.

Partially filled sewers are calculated by using partial flow diagram and tables indicating the relation between water depth, velocity of flow and rate flow. The hydraulic characteristics are similar as for open channels, but the velocity of flow is reduced by increased air friction in the pipe with increasing water level, particularly
near the top of the pipe. The velocity of flow and the flow rate are reduced at filling rates between $60 \%$ and $100 \%$; the water level in the pipe is unstable at filling rates above $90 \%$ or $95 \%$.

### 4.2.4 Storm Water Sewers Design

Designing a community storm system is not a simple task. It requires considerable experience and a great deal of information to make proper decisions concerning the layout, sizing, and construction of a storm network that is efficient and cost-effective. The design engineer needs to generally undertake the following tasks $\{9\}$ :

1. Define the service area.
2. Conduct preliminary investigations.
3. Develop preliminary layout plan and profile.
4. Selection of design parameters.
5. Review construction considerations.
6. Conduct field investigation and complete design and final profiles

## Service Area:

Service area is defined as the total area that will eventually be served by the drainage system. The service area may be based on natural drainage or political boundaries, or both. It is important that the design engineers and project team become familiar with the surface area of the proposed project.

## Preliminary Investigation:

The design engineer must conduct the preliminary investigations to develop a layout plan of the drainage system. Site visits and contacts with the city and local planning agencies and state officials should be made to determine the land use plans, zoning regulations, and probable future changes that may affect both the developed and undeveloped land. Data must be developed on topography, geology, hydrology, climate, ecological elements, and social and economic conditions. Topographic maps with existing and proposed streets and other utility lines provide the most important information for preliminary flow routing $\{9\}$.

If reliable topographic maps are not available, field investigations must be conducted to prepare the contours, place bench marks, locate building, utility lines, drainage ditches, low and high areas, stream, and the like. All these factors influence the sewer layout.

## Layout Plan:

Proper storm sewer layout plan and profiles must be completed before design flows can be established. The following is a list of basic rules that must be followed in developing a sewer plan and profile.

1. Select the site for disposal of the storm water at the end of the network, generally the lowest elevation of the entire drainage area.
2. The preliminary layout of storm sewers is made from the topographic maps. In general, sewers are located on streets, or on available right-of-way; and sloped in the same direction as the slope of the natural ground surface.
3. The trunk storm sewers are commonly located in valleys. Each line is started from the intercepting sewer and extended uphill until the edge of the drainage area is reached, and further extension is not possible without working downhill.
4. Main storm sewers are started from the trunk line and extended uphill intercepting the laterals.
5. Preliminary layout and routing of storm sewage flow is done by considering several feasible alternatives. In each alternative, factors such as total length of storm sewers, and cost of construction of laying deeper lines versus cost of construction, operation, and maintenance of lift station, should be evaluated to arrive at a cost- effective drainage system.
6. After the preliminary storm sewer layout plan is prepared, the street profiles are drawn. These profiles should show the street elevations, existing storm sewer lines, and manholes and inlets. These profiles are used to design the proposed lines.

Finally, these layout plans and profiles are revised after the field investigations and storm sewer designs are complete. $\{11\}$

## Selection of Design Parameters:

Many design factors must be investigated before storm sewer design can be completed. Factors such as design period; peak, average, and minimum flow; storm sewer slopes and minimum velocities; design equations ...etc. are all important in developing storm sewer design. Many of the factors are briefly discussed below.

## 1. Design Flow Rate

Storm water sewers should be designed to carry the largest storm that occurred in the period of design; commonly it is 5 years because of consideration of the cost and the frequently factors.

## 2. Minimum Size

The minimum storm sewer size recommended is 250 to 300 mm for closed system, and for open channel depend on the type of profile that selected.

## 3. Minimum and Maximum Velocities

In storm water sewers, solids tend to settle under low-velocity conditions. Selfcleaning velocities must be developed regularly to flush out the solids. Most countries specify minimum velocity in the sewers under low flow conditions. The minimum allowable velocity is $0.75 \mathrm{~m} / \mathrm{s}$, and $0.9 \mathrm{~m} / \mathrm{s}$ is desirable. This way the lines will be flushed out at least once or twice a day. The maximum velocities for storm water system are between 4 to $6 \mathrm{~m} / \mathrm{s}$. The maximum velocity is limited to prevent the erosion of sewer inverts.
4. Slope

For closed system minimum slopes determined from minimum velocities, for minimum velocity $1 \mathrm{~m} / \mathrm{s}$, the slopes are shown in Table (4.4).

Table 4.4 Minimum Recommended Slopes of Storm Sewer $(\mathrm{n}=0.015)\{8\}$

| Pipe Diameter (D) |  | Slope (min) | Slope (max) =1/D |
| :---: | :---: | :---: | :---: |
| $\mathbf{M m}$ | Inch | $\mathbf{M m}$ | $\mathbf{C m}$ |
| 250 | 10 | 0.00735 | 0.04 |
| 300 | 12 | 0.00576 | 0.033 |
| 450 | 18 | 0.00336 | 0.0222 |
| 600 | 24 | 0.00229 | 0.0167 |

Note: for a velocity of $0.75 \mathrm{~m} / \mathrm{s}$ the slopes shown above should be multiplied by 1.56 .
Maximum slopes determined from maximum velocities, 1/D (cm) can be used as a guide. For open channel, the slope also depends on the profile type, and generally used as the slope of the road.
5. Depth

The depth of storm sewers when using closed system is generally just enough to receive flow but not less than 1 m below the ground surface. Depth depends on the water table, lowest point to be served, topography, and the freeze depth. But for the open channel it is at the ground surface.

## 6. Appurtenances

Storm Sewer appurtenances include manholes, inlets, outlets and outfall, and others. Appropriate storm sewer appurtenances must be selected in design of storm water sewers.
7. Design Equations and Procedures

Storm water sewers are mostly designed to flow partially full. Once the peak, average, and minimum flow estimates and made general layout and topographic features for each line are established, the design engineer begins to size the sewers. Design equations proposed by Manning, Chezy, Gangullet, Kutter, and Scobey have been used for designing sewers and drains. The Manning equation, however, has received most widespread application. This equation is expressed below:

$$
\begin{equation*}
V=(1 / n) R^{2 / 3} S^{1 / 2} \tag{4.9}
\end{equation*}
$$

And as mentioned earlier, the runoff flow is calculated using the following formula:

$$
\begin{equation*}
\mathrm{Q}=\mathrm{C} . \mathrm{i} . \mathrm{A} \tag{4.3}
\end{equation*}
$$

Various types of nomographs have been developed for solution of problems involving sewers flowing full. Nomographs based on Manning's equation for circular pipe flowing full and variable $n$ values are provided in Figure(4.1). Hydraulic elements of circular pipes under partially-full flow conditions are provided in Figure (4.2). It may be noted that the value of $n$ decreases with the depth of flows Figure( 4.1). However, in most designs n is assumed constant for all flow depths. Also, it is a common practice to use d , v , and q notations for depth of flow, velocity, and discharge under partial flow condition while $\mathrm{D}, \mathrm{V}, \mathrm{Q}$ notations for diameter, velocity, and discharge for sewer flowing full. Use of equations 4.8 and 4.9 and (Figures 4.1 and 4.2), one can design the drainage system.

Figure4.1 Nomo graph for solution of manning formula $\{3\}$

Figure 4.2 Hydraulic properties of circular sewer $\{3\}$

## Design Computation:

After the preliminary sewer layout plan and profile are prepared, the design computations are accomplished. Design computations for sewers are repetitious and therefore, are best performed in a tabular format.

## Preparation of Maps and Profile:

It is important that the detailed drawings be prepared and specifications completed before the bide can be requested. The contract drawings should show (1) surface features, (2) depth and character of material to be excavated, (3) the existing structures that are likely to be encountered, and (4) the details of sewer and appurtenances to be constructed.

## Important Numbers:

- Maximum velocity $=5 \mathrm{~m} / \mathrm{s}$
- Minimum velocity $=1 \mathrm{~m} / \mathrm{s}$
- Maximum slope $=15 \%$
- Minimum slope $=0.5 \%$
- $\mathrm{H} / \mathrm{D}=100 \%$
- Minimum Diameter 250-300 mm
- Minimum cover 1 m
- Maximum cover 5 m

### 4.3 Roadways And Geometric Design:

During this work the main road of the camp will be redesign, this requiers field work and computer work to redesign, this will be as following:

1- Using aerial photograph to select the primary route.
2- Select the best places for traverse stations and set it on the ground using GPS.
3- Making the traverse by GPS stations, then use total station to calculate the coordinate of stations and make traverse corrections.

4- Making field survey using Total Station and show all road description depending on traverse stations.

5- Planning and redesign the road paths and do the vertical and horizontal curves calculations.

6- Make the profile and cross section.
7- Survey quantity calculations.

## A.4.3 Traversing

## A.4.3.1 General:

Since the advent of EDM and Total Station equipment, traversing has emerged as the most popular method of establishing control networks not only in engineering surveying but also in geodetic work, in civil engineering it lends itself ideally to surveys and dimensional control of route-type projects such as highway and pipeline construction. $\{7\}$

Traverse networks have the following advantages:

1. Little reconnaissance is required compared with that needed for an interconnected network of points.
2. Observations only involve three stations at a time so planning the task is simple.
3. Traversing may permit the control to follow the route of a highway, pipe line or tunnel, etc., with the minimum number of stations.

## A.4.3.2 Types of traverse:

There are three types of traverse, each type used in different condition. The liability of a traverse to undetected error makes it essential that there should be some external check on its accuracy. To this end the traverse may commence from and connect into known points of greater accuracy than the traverse. In this way the error vector of misclose can be quantified and distributed throughout the network, to produce geometric correctness. Such a traverse is called a 'link' traverse. $\{7\}$
Alternatively, the error vector can be obtained by completing the traverse back to its starting origin. Such a traverse is called a 'polygonal' or 'loop' traverse. Both the 'link' and 'polygonal' traverse are generally referred to as 'closed' traverses.
The third type of traverse is the 'free' or 'open' traverse, which does not close back onto any known point and which therefore has no way of detecting or quantifying the errors.

## 1. Link Traverse:

Fig(4.3): Link Traverse

Figure (4.3) illustrates a typical link traverse commencing from higher order point Y and closing onto Point W , with terminal orienting bearing to points X and Z . Generally, points X, Y, W and Z would be part of a higher order control network, although this may not always be the case. It may be that when tying surveys into the OSNG, due to the use of very precise Total Station equipment the intervening traverse is more precise than the relative positions of the NG stations. This is purely a problem of scale arising from a lack of knowledge, on the behalf of the surveyor, of the
positional accuracy of the grid points. In such a case, adjustment of the traverse to the NG could result in distortion of the intervening traverse.

The usual form of an adjustment generally adopted in the case of a link traverse is to hold points Y and W fixed whilst distributing the error throughout the intervening points.

This implies that points Y and W are free from error and is tantamount to allocating a weight of infinity to the length and bearing of line YW. It is thus both obvious and important that the control into which the traverse is linked should be of a higher order of precision than the connecting traverse.
The link traverse has certain advantages over the remaining types, in that systematic error in distance measurement and orientation are clearly revealed by the error vector. $\{7$ \}

## 2. Loop Traverse:

Fig(4.4.a): Loop Traverse(independent)

Fig(4.4.b): Loop Traverse(oriented)

Figures (4.4.a)and (4.4.b) illustrate the concept of a polygonal traverse. This type of network is quite popular and is used extensively for peripheral control on all types of engineering sites. If no orientation facility is available, the control can only be used for independent sites and plans and cannot be connected to other survey systems.

In this type of traverse the systematic errors of distance measurement are not eliminated and enter into the result with their full weight. Similarly, orientation error
would simply cause the whole network to swing through the amount of error involved and would not be revealed in the angular misclosure. $\{7\}$

## 3. Open(free) Traverse:

Fig(4.5): Open Traverse
Figure (4.5) illustrates the open traverse which does not close into any known point and therefore cannot provide any indication of the magnitude of measuring errors.

In all surveying literature, this form of traversing is not recommended due to the lack of checks. Nevertheless, it is frequently utilized in mining and tunnelling work because of the physical restriction on closure. $\{7\}$

## A.4.3.3 Accuracy Standards For Traverse:

Table (4.5) shows Horizontal Control Accuracy Standards For Traverse(By The Federal Geodetic Control Subcommittee (FGCS).

Using each order depending on the type of work, small surveying works used third order but huge construction use first order. \{7\}

* Table (4.5) : Horizontal Control Accuracy Standards For Traverse(By The Federal Geodetic Control)

| Order | 1st | 2 nd |  | 3 rd |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Class |  | I | II | I | II |
| Angular <br> Closure | $1.7 \times \sqrt{n}$ | 3.09 ل ${ }^{\text {n }}$ | 4.5 " $\sqrt{n}$ | 10.0 " ${ }_{n}$ | 12.0 " $V_{n}$ |
| Linear Closure (after angul. adj.) | $\begin{aligned} & 0.04 \sqrt{ } \mathrm{~L} \\ & \text { or, } \\ & 1 / 100,000 \end{aligned}$ | $\begin{aligned} & 0.08 \sqrt{ } \mathrm{~L} \\ & \text { or, } \\ & 1 / 50,000 \end{aligned}$ | $\begin{aligned} & 0.20 \sqrt{ } \Sigma \mathrm{~L} \\ & \text { or, } \\ & 1 / 20,000 \end{aligned}$ | $\begin{gathered} 0.40 \sqrt{ } \Sigma \mathrm{~L} \\ \text { or, } \\ 1 / 10,000 \end{gathered}$ | $\begin{gathered} 0.80 \sqrt{ } \mathrm{~L} \\ \text { or, } \\ 1 / 5,000 \end{gathered}$ |

## A.4.3.4 Adjustment of Traverse using"Least square method":

$$
\begin{equation*}
X=I^{T} I^{-1} I^{T} K \tag{4.10}
\end{equation*}
$$

Where:
X: Unkown Matrix.
J: Jacobean Matrix.
K: Observation Matrix.
V: Variance Matrix.

And here are the matrices forms:

- The Jacobean Matrix:

$$
\begin{array}{cccccccc}
\frac{\partial F_{1}}{\partial d x_{1}} & \frac{\partial F_{1}}{\partial d y_{1}} & \frac{\partial F_{1}}{\partial d x_{2}} & \frac{\partial F_{1}}{\partial d y_{2}} & \ldots & \ldots & \ldots & \frac{\partial F_{1}}{\partial d x_{n}}
\end{array} \frac{\frac{\partial F_{1}}{\partial d y_{n}}}{\frac{\partial F_{2}}{\partial d x_{1}}} \begin{gathered}
\frac{\partial F_{2}}{\partial d y_{1}} \\
\\
\\
\vdots  \tag{4.11}\\
\\
\\
\vdots
\end{gathered}
$$

$\mathrm{J}=$

$$
\begin{array}{llllllll}
\frac{\partial F_{m-1}}{\partial d x_{1}} & \frac{\partial F_{m-1}}{\partial d y_{1}} & \frac{\partial F_{m-1}}{\partial d x_{2}} & \frac{\partial F_{m-1}}{\partial d y_{2}} & \ldots & \ldots & \ldots & \frac{\partial F_{m-1}}{\partial d x_{n}}
\end{array} \frac{\frac{\partial F_{m-1}}{\partial d y_{n}}}{\frac{\partial F_{m}}{\partial d x_{1}}} \begin{array}{llllll}
\partial d y_{1} & \frac{\partial F_{m}}{\partial d x_{2}} & \frac{\partial F_{m}}{\partial d y_{2}} & \ldots & \ldots & \ldots \\
\frac{\partial F_{m}}{\partial d x_{n}} & \frac{\partial F_{m}}{\partial d y_{n}}
\end{array}
$$

- Distance Observation Reduction:

$$
\begin{equation*}
F_{x_{i}, y_{i}, x_{j}, y_{j}}=\overline{x_{j}-x_{i}^{2}+y_{j}-y_{i}^{2}} \tag{4.12}
\end{equation*}
$$

- Linearization:

Taking the derivatives of last equation

$$
\begin{align*}
& \frac{\partial F}{\partial x_{i}}=\frac{x_{i}-x_{j}}{l j}  \tag{4.13}\\
& \frac{\partial F}{\partial y_{i}}=\frac{y_{i}-y_{j}}{l j}  \tag{4.14}\\
& \frac{\partial F}{\partial x_{j}}=\frac{x_{j}-x_{i}}{l j}  \tag{4.15}\\
& \frac{\partial F}{\partial y_{j}}=\frac{y_{j}-y_{l}}{l j} \tag{4.16}
\end{align*}
$$

- Angle Observation reduction:

$$
\begin{align*}
\theta & =A z_{l F}-A z_{l B}  \tag{4.17}\\
\theta & =\tan ^{-1} \frac{x_{f}-x_{l}}{y_{f}-y_{l}}-\tan ^{-1} \frac{x_{b}-x_{l}}{y_{b}-y_{l}}+D \tag{4.18}
\end{align*}
$$

- Taking the derivatives of the last equation:

$$
\begin{align*}
& \frac{\partial F}{\partial x_{i}}=\frac{y_{i}-y_{b}}{l B^{2}}-\frac{y_{i}-y_{f}}{l F^{2}}  \tag{4.19}\\
& \frac{\partial F}{\partial y_{i}}=\frac{x_{b}-x_{i}}{l B^{2}}-\frac{x_{f}-x_{i}}{l F^{2}} \tag{4.20}
\end{align*}
$$

- Observation matrix K :

$$
\mathrm{K}=\begin{gather*}
F_{1}-F_{1 o} \\
F_{2}-F_{2 o} \\
\vdots  \tag{4.21}\\
\vdots \\
\vdots \\
F_{n}-F_{n o}
\end{gather*}
$$

- The weight Matrix W:

$$
\mathrm{W}={ }^{\sigma F_{1}^{2}} \begin{array}{ll} 
& \\
& \\
& \\
& \\
& \\
& \\
& F_{3}^{2}
\end{array}
$$

$$
\begin{equation*}
\sigma F_{n}^{2} \tag{4.22}
\end{equation*}
$$

- Unknown Matrix X:

$$
\mathrm{X}=\begin{gather*}
d x_{1}  \tag{4.23}\\
d y_{1} \\
d x_{2} \\
d y_{2} \\
\vdots \\
\vdots \\
\vdots \\
\vdots \\
d x_{n} \\

\end{gather*}
$$

- Corrected coordinates:
- $X=X_{o}+d_{x}$
- $Y=Y_{o}+d_{y}$

## B.4.3 Geometric Design Elements:

From an operational viewpoint, it is the geometric characteristics of the roadway that primarily influence traffic flow and operations. Three main elements define the geometry of a highway section:

- Horizontal alignment.
- Vertical alignment.
- Cross-sectional elements.

## B.4.3.1 Horizontal alignment of Roadways:

## - Degree of curvature:

Degree of curvature is the central angle D subtended by a chord of 30 meter.

- $D=\frac{1718.87}{R} \quad$ OR $\quad D=\frac{30 \Delta}{L}$
- Horizontal Curves:

When a highway changes horizontal direction, making the point where it changes direction a point of intersection between two straight lines is not feasible.

The change in direction would be too abrupt for the safety of modem, high-speed vehicles. It is therefore necessary to interpose a curve between the straight
lines. The straight lines of a road are called tangents because the lines are tangent to the curves used to change direction.

The principal consideration in the design of a curve is the selection of the length of the radius or the degree of curvature. This selection is based on such considerations as the design speed of the highway and the sight distance as limited by headlights or obstructions.\{7\}

Types of Horizontal Curves:
1- Circular Curves.
2- Compound Circular Curves.
3- Broken Back Circular Curves (not used in the project).
4- Reversed Circular Curves (not used in the project).
5- Transition Curve.

## 1. Simple Circular Curves:

The simple curve is an arc of a circle .The radius of the circle determinesthe sharpness or flatness of the curve, this type of curves will used in this project. $\{7\}$

Fig(4.6): Simple Circular Curve.
Simple Curve Elements:

- PI: point Of Intersection.
- I: Intersection Angle.
- R: Radius.
- PC: Point of curvature.
- D: Degree of Curve
- T : tangent distance.
- E: External distance
- M: Middle Ordinate.
- LC: Long Chord.
- L: Curve length.
- $\Delta$ : Deflection Angle.
- Simple Curves Equation:
- $\theta^{\backslash}=\theta-2 \emptyset$
- $L=\frac{\pi R \Delta}{180}$
- $c=\frac{R}{20}$
- $\delta^{\backslash}=1718.8 * \frac{c}{R}$
- $T=R \tan \frac{\Delta}{2}$
- $E=R \sec _{\frac{\Delta}{2}}-1$
- $M=R \quad 1-\cos \frac{\Delta}{2}$
- $L C=2 R \sin \frac{\Delta}{2}$

## 2. Compound curves:

Compound curve consists of two curves that are joined at a point of tangency and are located on the same side of a common tangent. Though their radii are in the same direction, they are of different values. $\operatorname{Fig}(4.7)$

Fig(4.7) compound curve.
Where:
$R_{1}$ and $R_{2}=$ radii of simple curves forming the compound curve
$\theta_{1}$ and $\theta_{2}=$ intersection angles of simple curves
$t_{1}$ and $t_{2}=$ tangent lengths of simple curves
$T_{1}$ and $T_{2}=$ tangent lengths of compound curves
$\Delta=$ intersection angle of compound curve

- Compound Curves Equation:

$$
\begin{align*}
\Delta & =\Delta 1+\Delta 2  \tag{4.36}\\
\mathrm{t} 1 & =\mathrm{R} 1 \tan \frac{\Delta 1}{2}  \tag{4.37}\\
\mathrm{t} 2 & =\mathrm{R} 2 \tan \frac{\Delta 2}{2} \tag{4.38}
\end{align*}
$$

## 3. Reverse Curves:

Reverse curves usually consist of two simple curves with equal radii turning in opposite directions with a common tangent. They are generally used to change the alignment of a highway. Figure (4.8) shows a reverse curve with parallel tangents.

Figure (4.8) Geometry of a Reverse Curve with Parallel Tangents
Reverse curves are seldom recommended because sudden changes to the alignment may result in drivers finding it difficult to keep in their lanes. When it is necessary to reverse the alignment, a preferable design consists of two simple horizontal curves, separated by a sufficient length of tangent between them, to achieve full super
elevation. Alternatively, the simple curves may be separated by an equivalent length of spiral, which is described in the next section.

## - Super Elevation of Horizontal Curve:

Superelevation is the banking of the roadway along a horizontal curve so motorists can safely and comfortably maneuver the curve at reasonable speeds. As speeds increase and horizontal curves become tighter a steeper superelevation rate is require see figure (4.9).

Fig(4.9)Super Elevation

$$
\begin{equation*}
e=\frac{(V * 0.75)^{2}}{127 R} \tag{4.39}
\end{equation*}
$$

Where:

- R: Radius of the curve.
- V: vehicles speed.
- F: Side friction.
- e: Super elevation rate.

But if e is grater than $e_{\max }(9 \%)$ side fraction f should be:

$$
\begin{equation*}
f=\frac{(V * 0.75)^{2}}{127 R}-e_{\max } \tag{4.40}
\end{equation*}
$$

## 4. Transition curves

The transition curve is a curve of constantly changing radius. If used to connect a straight to a curve of radius R, then the commencing radius of the transition will be the same as the straight $(\infty)$, and the final radius will be that of the curve $R$,see figure (4.10).

Fig(4.10): Transition curve

When the vehicle enters the curve of radius R at tangent point T , an additional centrifugal force $(\mathrm{P})$ acts on the vehicle, as shown in figures (4.11a and 4.11b). If P is large the vehicle will be forced to the outside of the curve and may skid or overturn. In Figure (4.11b) the resultant of the two forces is shown as N , and if the road is super-elevated normal to this force, there will be no tendency for the vehicle to skid. It should be noted that as:

$$
\begin{equation*}
\mathrm{P}=\mathrm{WV} 2 / \mathrm{Rg} \tag{4.41}
\end{equation*}
$$

Fig(4.11a)centrifugal force

Fig(4.11b)super elevation

## - Sight Distance on Horizontal Curves:

One of the most fundamental design criteria for all highway facilities is that a minimum sight distance equal to the safe stopping distance must be provided at every point along the road way. On horizontal curves, sight distance is limited by roadside objects (on the inside of the curve) that block drivers' line of sight. Roadside objects such as buildings, trees, and natural barriers disrupt motorists' sigh lines.

Safe stopping distance used in each of these equations may be computed as:
$d=0.278 \mathrm{vt}+\frac{\mathrm{v}^{2}}{\left.254\left(\left(\frac{\mathrm{a}}{91}\right) \pm \mathbf{G}\right)\right)}$
Where:
$d=$ safe stopping distance, m
$\mathrm{v}=$ design speed, $\mathrm{km} \backslash \mathrm{h}$
$t=$ reaction time, secs
$\mathrm{G}=$ grade,$\%$

## B.4.3.2 Vertical Alignment of Roadways:

The vertical alignment of a highway is the profile design of the facility in the vertical plane. The vertical alignments composed of a series of vertical tangents connected by vertical curves. Vertical curves are in the shape of a parabola. This provides for a natural transition from a tangent to a curved section as part of the curve characteristics. Therefore, there is no need to investigate or provide transition curves, such as the spiral for horizontal curves.

## - Geometric Characteristics of Vertical Curves:

In addition to horizontal curves that go to the right or left, roads also have vertical curves that go up or down. Vertical curves at a crest or the top of a hill are called summit curves, or over verticals. Vertical curves at the bottom of a hill or dip are called sag curves, or under verticals.

Vertical curves are used to connect stretches of road that go up or down at a constant slope. These lines of constant slope are called grade tangents.

Vertical curves are in the shape of parabola see figure (4.12). In general, there are two types of vertical curves:

- Crest vertical curves.
- Sag vertical curves.

The rate of slope is called the gradient, or simply the grade. Grades that ascend in the direction of the stationing are designated as plus; those that descend in the direction of the stationing are designated as minus. Grades are measured in terms of percent; that is, the number of feet of rise or fall in a 100 foot horizontal stretch of the road. $\{7\}$

Fig(4.12): Vertical Curve.

Vertical Curves Elements:

- $\mathrm{A}=$ Algebraic difference in gradients, g2-g1.
- $\mathrm{L}=$ Total length of vertical curve.
- $\mathrm{K}=$ Rate of vertical curvature.
- $\quad$ VPC $=$ Vertical Point of Curvature.
- $\mathrm{VPT}=$ Vertical Point of Tangency.
- $\mathrm{VPI}=$ Vertical Point of Intersection.
- $x=$ Horizontal distance to any point on the curve from the VPC.
- $\mathrm{xt}=$ Turning point, which is the minimum or maximum point of the curve.
- $\mathrm{e}=$ Vertical offset or middle ordinate, which is the vertical distance from the VPI to the arc.
- $y=$ Vertical distance at any point on the curve to the tangent grade.
- $r=$ Rate of change of grade.
- EVPC = Elevation of VPC.
- EVPT = Elevation of VPT.
- Ex $=$ Elevation of a point on the curve at a distance x from the VPC.
- $\mathrm{Et}=$ Elevation of the turning point.

Vertical curves equations:

- $A=g_{2}-g_{1}$
- $K=\frac{L}{A}$
- $R=\frac{A}{100 L}$
- $e=\frac{A L}{800}$

Minimum length of vertical curves:

- Crest vertical curves:

When $S$ is less than $L$

- $L=\frac{A S^{2}}{100\left(\overline{2 h_{1}}+\overline{2 h_{2}}\right)^{2}}$

When S is greater than L

- $L=2 S-\frac{200\left(\overline{h_{1}}+\overline{h_{2}}\right)^{2}}{A}$

Where:

- $\mathrm{L}=$ Length of vertical curve.
- $\mathrm{S}=$ Sight distance.
- $\mathrm{A}=$ Algebraic difference in gradients.
- $h 1=$ Height of eye above roadway surface.
- $\mathrm{h} 2=$ Height of object above roadway surface.
- Sag vertical curves:

When S is less than L

- $L=\frac{A S^{2}}{120+3.5 S}$

When S is greater than L

- $L=2 S-\left(\frac{120+3.55}{A}\right)$

Where:

- $L=$ Length of vertical curve.
- $\mathrm{S}=$ Sight distance.
- $\mathrm{A}=$ Algebraic difference in gradients.
- Stopping sight distance:

Stopping sight distance is required at all locations along the highway, to see an 150 $\mathrm{mm}(0.5 \mathrm{ft})$ object. The stopping sight distance is typically required at all intersections and approaches.

Fig(4.13)visibility on vertival curve

- $S S D=0.278 V t+\frac{V^{2}}{254(f \pm g)}$

Where:

- $\operatorname{SSD}=$ required stopping sight distance, $m$.
- $\mathrm{V}=$ speed.
- $\mathrm{t}=$ perception-reaction time, sec., typically 2.5 sec . for design
- $\mathrm{f}=$ coefficient of friction, typically for a poor, wet pavement
- $\mathrm{g}=$ grade, decimal.
- Passing Sight Distance :

Passing sight distance (PSD) is a key consideration in the design of two -lane highways and the marking of passing and no-passing zones on two-lane highways.
$\mathrm{PSD}=\mathrm{d} 1+\mathrm{d} 2+\mathrm{d} 3+\mathrm{d} 4$

Where:
$\mathrm{dl}=$ distance traveled during perception and reaction time and during initial acceleration to the point of encroachment on the left lane;
$\mathrm{d} 2=$ distance travelled while passing vehicle occupies the left lane.
$\mathrm{d} 3=$ distance between passing vehicle and opposing vehicle at the end of passing maneuver
$\mathrm{d} 4=$ distance travelled by an opposing vehicle for two-thirds of the time the passing vehicle occupies the left lane or $2 / 3$ of d2

Figure (4.14) Passing Sight Distance for two lanes

## B.4.3.3 Cross-Section Elements

The cross-section of a highway includes a number of elements critical to the design of the facility. The crosss ection view of a highway is a $90^{\circ}$ cut across the facility from roadside to roadside see figure (4.15). The cross-section includes the following features:

- Travel lanes
- Shoulders
- Side slopes
- Curbs
- Medians and median barriers
- Guardrails
- Drainage channels

Figure (4.15) Typical Cross Section for Two-Lane Highway

## Travel Lanes and Pavement:

Paved travel lanes provide the space that moving (and sometimes parked) vehicles occupy during normal operations. The standard width of a travel lane is 12 ft (metric standard is 3.6 m ), although narrower lanes are permitted when necessary. The minimum recommended lane width is 9 ft (metric standed 2.7 m ) . lanes wider than 12 ft are sometimes provided on curves to account for the off-tracking of the rear wheels of large trucks. Narrow lanes will have a negative impact on the capacity of the roadway and on operations . in general, 9 ft acceptable only on low-volume, low speed rural or residential roadways.

- In this project the used minimum lane width is 2.75 m .

## Shoulders:

A shoulder is the portion of the roadway contiguous with the traveled way that accommodates stopped vehicles, emergency use, and lateral support of sub-base, base , and surface courses (of the roadway structure), Shoulders are generally considered necessary on rural highways serving a significant mobility function

- For low volume urban roads and difficult terrain, no shoulder is provided in this project.

## Side-Slopes for Cuts and Embankments:

Where roadways are located in cut sections or on embankments, side-slopes must be carefully designed to provide for safe operation. In urban areas, sufficient right-of-
way is generally not available to provide for natural side-slopes, and retaining walls are frequently used.

Table (4.6) Guide for Earth Slope Design

| Height of Cut or <br> Fill (ft) | Earth Slope, for Type of Terrain |  |  |
| :---: | :---: | :---: | :---: |
|  | Flat or rolling | Moderately steep | Steep |
| $0-4$ | $6: 1$ | $6: 1$ | $4: 1$ |
| $4-10$ | $4: 1$ | $4: 1$ | $2: 1$ |
| $10-15$ | $4: 1$ | $2.5: 1$ | $1.75: 1$ |
| $15-20$ | $2: 1$ | $2: 1$ | $1.5: 1$ |
| Over 20 | $2: 1$ | $2: 1$ | $1.5: 1$ |

- From table (4.6), in this project the side slope is $4: 1$

## Curbs and Gutter:

Curbs are raised structures made of either Portland cement concrete or bituminous concrete (rolled asphalt curbs) that are used mainly on urban highways to delineate pavement edges and pedestrian walkways. Curbs are also used to control drainage, improve aesthetics, and reduce right of way. Curbs can be generally classified as either vertical or sloping. Range in height from 6 " to 8 " with steep sides, and are designed to prevent vehicles from leaving the roadway. Gutters or drainage ditches are usually located on the pavement side of a curb to provide the principal drainage facility for the highway. They are sloped to prevent any hazard to traffic, and they usually have cross slopes of 5 to 8 percent and are 1 to 6 ft wide. Gutters can be designed as V-type sections or as broad, flat, rounded sections see figure (4.16).

(a) Vertical curb

Figure (4.16) Typical Highway Curbs

- Vertical curbs that are used on edge of side walk to prevent vehicles from leaving the roadway.

## Median:

A median is the section of a divided highway that separates the lanes in opposing directions. The width of a median is the distance between the edges of the inside lanes, including the median shoulders. Medians can either be raised, flush, depressed, or paint striped.

- The median used in this project is a paint-striped separation median.

## Guard Rails:

Guard rails are longitudinal barriers placed on the outside of sharp curves and at sections with high fills. Their main function is to prevent vehicles from leaving the roadway. They are installed at embankments higher than 8 ft and when shoulder slopes are greater than $4: 1$. Shapes commonly used include the W beam and the box beam. The weak post system provides for the post to collapse on impact, with the rail deflecting and absorbing the energy due to impact.

- When side slope is not greater than $4: 1$ and embankment higher less than 8 ft , then the region don't need guard rail.

## Sidewalks:

Sidewalks are usually provided on roads in urban areas, but are uncommon in rural areas.

- The road in this project is providing in sidewalk in areas with high pedestrian concentrations at adjacent to schools.

## C.4.3 Traffic control device and traffic stream characteristic

Traffic control devices are the media by which traffic engineers (communicate with drivers. Virtually every traffic law, regulation, or operating instruction must be communicated through the use of devices that fall into three broad categories:

- C.4.3.1 Traffic markings
- C.4.3.2 Traffic signs
- C4.3.3 Traffic signals

The MUTCD (Manual on Uniform Traffic Control Devices) states that the purpose of traffic control devices is "to promote highway safety and efficiency by providing for orderly movement of all road users on streets and highways, throughout the Nation. It also defines five requirements for a traffic control device to be effective in fulfilling that mission. A traffic control device must:

1. Fulfill a need
2. Command attention
3. Convey a clear, simple message
4. Command respect of road users
5. Give adequate time for a proper response

## Communicating with the Driver:

The driver is accustomed to receiving a certain message in a clear and standard fashion, often with redundancy. A number of mechanisms are used to convey messages.These mechanisms make use of recognized human limitations, particularly with respect to eyesight. Messages are conveyed through the use of:

1. Color. Color is the most easily visible characteristic of a device. Color is recognizable long before a general shape may be perceived and considerably before a specific legend can be read and understood. The principal colors used in traffic control devices are red, yellow, green, orange, black, blue, and brown. These are used to code certain types of devices and to reinforce specific messages whenever possible.
2. Shape. After color, the shape of the device is the next element to be discerned by the driver. Particularly in signing, shape is an important element of the message, either identifying a particular type of information that the sign is conveying or conveying a unique message of its own.
3. Pattern. Pattern is used in the application of traffic markings. In general, double solid, solid, dashed, and broken lines are used. Each conveys a type of meaning with which drivers become familiar. The frequent and consistent use of similar patterns in similar applications contributes greatly to their effectiveness and to the instant recognition of their meaning.
4. Legend. The last element of a device that the driver comprehends is its specific legend. Signals and markings, for example, convey their entire message through use of color, shape, and pattern. Signs, however, often use specific leg end to transmit the details of the message being transmitted. Legend must be kept simple and short, so that drivers do not divert their attention from the driving task, yet are able to see and understand the specific message being given.

## C.4.3.1 Traffic Markings:

Traffic markings are the most plentiful traffic devices in use. They serve a variety of purposes and functions and fall into three broad categories:

- Longitudinal marking
- Transverse markings
- Object markers and delineators

## Colors and Patterns:

Five marking colors are in current use: yellow, white, red, blue, and black. In general, they are used as follows:
A. Yellow line's separate traffic traveling in opposite directions.
B. White markings separate traffic traveling in the same direction, and are used for all transverse markings.
C. Red line's delineate roadways that shall not be entered or used by the viewer of the marking.
D. Blue markings are used to delineate parking spaces reserved for persons with disabilities.
E. Black markings are used in conjunction with other markings on light pavements. To emphasize the pattern of the line, gaps between yellow or white markings are filled in with black to provide contrast and easier visibility.

Normally, line markings are 4 to 6 inches wide. Wide lines, which provide greater emphasis, should be at least twice the width of a normal line. Broken lines normally consist of $10-\mathrm{ft}$ line segments and $30-\mathrm{ft}$ gaps. Similar dimensions with a similar ratio of line segments to gaps may be used as appropriate for prevailing traffic speeds and the need for delineation. Dotted lines usually consist of $2-\mathrm{ft}$ line segments and $4-\mathrm{ft}$ (or longer) gaps. MUTCD suggests a maximum segment -to-gap ratio of 1:3 for dotted lines.

## Longitudinal Markings:

Longitudinal markings are those markings placed parallel to the direction of travel. The vast majority of longitudinal markings involve centerlines, lane lines, and pavement edge lines.

Longitudinal markings provide guidance for the placement of vehicles on the traveled way cross -section and basic trajectory guidance for vehicles traveling along the facility. The best example of the importance of longitudinal markings is the difficulty in traversing a newly paved highway segment on which lane markings have not yet been repainted. Drivers do not automatically form neat lanes without the guidance of longitudinal marlungs; rather, they tend to place themselves some what randomly on
the cross-section, encountering many difficulties. Longitudinal markings provide for organized flow and optimal use of the pavement width.

## Transverse Markings:

Transverse markings, as their name implies, include any and all markings with a component that cuts across a portion or all of the traveled way. When used, all transverse markings are white.

- Application of transverse marking:

1. STOP Lines: stop lines are not mandated by the MUTCD. In practice, STOP lines are almost always used where marked crosswalks exist, and in situations where the appropriate location to stop for a STOP sign or traffic signal is not clear.
2. Crosswalk Markings: while not mandated by the MUTCD, it is recommended that crosswalks be marked at all intersections at which "substantial" conflict between vehicles and pedestrians exists. They should also be used at points of pedestrian concentration and at locations where pedestrians might not otherwise recognize the proper place and/or path to cross. A marked crosswalk should be 6 ft or more in width.
3. Word and Symbol Markings: the MUTCD prescribes a number of word and symbol markings that may be used, often in conjunction with signs and or signals. These include arrow markings indicating lane-use restrictions. Such arrows (with accompanying signs) are mandatory where a through lane becomes a left - or right-turn-only lane approaching an intersection. Word markings include "ONLY," used in conjunction with lane use arrows, and "STOP," which can be used only in conjunction with a STOP line and a STOP sign. "SCHOOL" markings are often used in conjunction with signs to demark school and school-crossing zones. The MUTCD contains a listing of all authorized.

## Object Markers:

Object markers are used to denote obstructions either in or adjacent to the traveled way. Object markers are mounted on the obstruction in accordance with MUTCD standards and guidelines. In general, the lower edge of the marker is mounted a minimum of 4 ft above the surface of the nearest traffic lane (for obstructions 8 ft or less from the pavement edge) or 4 ft above the ground (for obstructions located further away from the pavement edge).
table(4.7) type and application of traffic marking\{16\}

| TYPE | MARKING | THICKNE <br> SS | RATIO <br> S/V | APPLICATION |
| :---: | :---: | :--- | :--- | :--- |
| Lane lines |  |  |  |  |
| (white) |  |  |  |  |

## C.4.3.2 Traffic Signs:

The MUTCD provides specifications and guidelines for the use of literally hundreds of different signs for myriad purposes. In general, traffic signs fall into one of three major categories:
A. Regulatory signs: Regulatory signs convey information concerning specificbtraffic regulations. Regulations may relate to right -of-way, speed limits, lane usage, parking, or a variety of other functions.
B. Warning signs: Warning signs are used to inform drivers about upcoming hazards that they might not see or otherwise discern in time to safely react.
C. Guide signs: Guide signs provide information on routes, destinations, and services that drivers may be seeking.

## A. Regulatory Signs:

Regulatory signs shall be used to inform road users of selected traffic laws or regulations and indicate the applicability of the legal requirements. Regulatory signs shall be installed at or near where the regulations apply. The signs shall clearly indicate the requirements imposed by the regulations and shall be designed and installed to provide adequate visibility and legibility in order to obtain compliance.
The regulatory signs in this category have special designs reflecting the extreme danger that exists when one is ignored. These signs include the STOP and YIELD signs, which assign right -of-way at intersections, and WRONG WAY and ONE WAY signs, indicating directional flow. The STOP and YIELD signs have unique shapes, and they use a red background color to denote danger. The WRONGWAYsign also uses a red background for this purpose see figure (4.17).

Figure (4.17) regulatory signs.

## B. Warning Signs:

Warning signs call attention to unexpected conditions on or adjacent to a highway or street and to situations that might not be readily apparent to road users. Warning signs alert road users to conditions that might call for a reduction of speed or an action in the interest of safety and efficient traffic operations see figure (4.18).

Figure (4.18) Warning signs.

## C. Guide Signs:

Guide signs provide information to road users concerning destinations, available services, and historical facilities. They serve a unique purpose in that drivers who are familiar or regular users of a route will generally not need to use them; they provide critical information, however, to unfamiliar road users. They serve a vital safety function: a confused driver approaching a junction or other decision point is a distinct hazard see figure (4.19).

Figure (4.19) guide signs.

## C.4.3.3Traffic Signals:

The MUTCD defines seven types of traffic signals:

1. Traffic control signals.
2. Pedestrian signals.
3. Emergency vehicle traffic control signals.
4. Facilities ramps.
5. Traffic control signals for freeway entrance.
6. Traffic control signals for moveable bridges Lane-use control signals.
7. In-roadway lights.

## Traffic Stream Characteristics:

Traffic stream parameters fall into two broad categories.

- Macroscopic parameters describe the traffic stream as a whole:
- Microscopic parameters describe the behavior of individual vehicles or pairs of vehicles within the traffic stream.

The three principal macroscopic parameters that describe a traffic stream are:

1. Volume or rate of flow,
2. Speed,
3. Density.

## Volume and Rate of Flow:

Traffic volume is defined as the number of vehicles passing a point on a highway, or a given lane or direction of a highway, during a specified time interval. The unit of measurement for volume is simply "vehicles," although it is often expressed as "vehicles per unit time." Units of time used most often are "per day" or "per hour."

## Daily Volumes:

As noted, daily volumes are used to document annual trends in highway usage. Forecasts based upon observed trends can be used to help plan improved or new facilities to accommodate increasing demand. There are four daily volume parameters that are widely used in traffic engineering:

- Average annual daily traffic (AADT): The average 24-hour volume at a given location over a full 365 -day year; the number of vehicles passing a site in a year divided by 365 days ( 366 days in a leap year).
- Average annual weekday traffic (AAWT): The average 24 -hour volume occurring on weekdays over a full 365 -day year; the number of vehicles passing a site on weekdays in a year divided by the number of weekdays (usually 260).
- Average daily traffic (ADT): The average 24- hour volume at a given location over a defined time period less than one year; a common application is to measure an ADT for each month of the year.
- Average weekday traffic (AWT): The average 24- hour weekday volume at a given location over a defined time period less than one year; a common application is to measure an AWT for each month of the year.

## Hourly Volumes:

Daily volumes, while useful for planning purposes, cannot be used alone for design or operational analysis purposes. Volume varies considerably over the 24 hours of the day, with periods of maximum flow occurring during the morning and evening commuter "rush hours." The single hour of the day that has the highest hourly volume
is referred to as the peak hour. The traffic volume within this hour is of greatest interest to traffic engineers for design and operational analysis usage. The peak -hour volume is generally stated as a directional volume (i.e., each direction of flow is counted separately). Highways and controls must be designed to adequately serve the peak-hour traffic volume in the peak direction of flow.

In design, peak -hour volumes are sometimes estimated from projections of the AADT. Traffic forecasts are most often cast in terms of AADTs based on documented trends and/or forecasting models. Because daily volumes, such as the AADT, are more stable than hourly volumes, projections can be more confidently made using them. AADTs are converted to a peak -hour volume in the peak direction of flow. This is referred to as the "directional design hour volume" (DDHV), and is found using the following relationship:
$\mathrm{DDHV}=\mathrm{AADT} * \mathrm{~K} * \mathrm{D}$
where:
$\mathrm{K}=$ proportion of daily traffic occurring during the peak hour the peak direction of flow.
$\mathrm{D}=$ proportion of peak hour traffic traveling in the peak direction of flow.

## Chapter Five

## ANALYSIS AND DESIGN

### 5.1 Wastewater Collection System

### 5.1.1 General:

In this chapter, project team evaluate and design wastewater collection system for Al-Arroub camp, and develop a future plans for construction of the collection system, corresponding on population growth, water consumption, and after that calculate wastewater production in the future, in order as preliminary plan to reduce the problem causes by the disposal of wastewater in the area, the layout of the system established is presented followed by discussion of detailed design computation and the final design and specifications of the suggested wastewater collection system.

## 5. 1.2 Layout of the System:

The first step in designing a sewerage system is to establish an overall system layout that includes a plan of the area to be sewered, showing roads, streets, other utilities, topography, and all buildings to be drained in Drawing (D1) a Topography map is shown in appendix B .Care must be taken to provide adequate terminal manholes that can later be connected to the system constructed serving the area.

In establishing the layout of wastewater collection system for Al-Arroub Camp, the following basic steps were followed:

1. Obtain a topographic map of the area to be served.
2. Locate the drainage outlet. This is usually near the lowest point in the area and is often along a stream or drainage way. In Al-Arroub Camp, the lowest point is in the southern-east part of the camp.
3. Sketch in preliminary pipe system to serve all the contributors.
4. Pipes are located so that all the users or future users can readily tap on; they are also located so as to provide access for maintenance and thus are ordinarily placed in streets or other rights-of-way.
5. Sewers layout is followed natural drainage ways so as to minimize excavation and pumping requirements. Large trunk sewers are located in low-lying areas closely paralleling streams or channels.
6. Establish preliminary pipe sizes. Eight inches pipe size (usually the minimum allowable) can serve several hundred residences even at minimal grades.
7. Revise the layout so as to optimize flow-carrying capacity at minimum cost. Pipe lengths and sizes are kept as small as possible, pipe slopes are minimized, and followed the ground surface slope to minimize the depth of excavation, and the numbers of appurtenances are kept as small as possible.
8. The pumping is avoided across drainage boundaries. Pumping stations are costly and add maintenance problems.

The final layout of wastewater collection system for Al-Arroub camp is illustrated in drawing (D2, D3) in appendix B.

### 5.1.3 Design Computation:

The detailed design of sanitary sewers involves computation of the quantity of wastewater expected from the surroundings and upstream areas to the next pipe in series, subject to the appropriate design constrains. The design computations in the example given below.

## - Design example: Design a gravity flow sanitary sewer

1. To design a gravity flow trunk sanitary sewer for the area to outfall (line S1L1) in (Figure 5.1). Assume that the following design criteria have been developed and adopted based on an analysis of local conditions and codes.
2. For water consumption uses $75 \mathrm{~L} / \mathrm{c} . \mathrm{d}$ in 2007 and $120 \mathrm{~L} / \mathrm{c}$.d for the future in 2036 when the rate of increase in the consumption of water is equal $2 \%$ per year.
3. The wastewater calculates as $80 \%$ of the water consumption.
4. For infiltration allowance use $10 \%$ of the domestic sewerage flow.
5. For the hydraulic design equation use the Manning equation with $n$ value of 0.011 .
6. The population at the present time is 11915 while in the future "after 25 years" it is predicted to be equal 27156 persons with growth rate reach to $3.35 \%$.
7. Peaking factor depending on the formula :

$$
\begin{equation*}
P_{f}=1.5+\left(\frac{2.5}{\sqrt{9}}\right) \tag{4.1}
\end{equation*}
$$

8. Minimum pipe size: The building code specifies 200 mm (8in) as he smallest pipe permissible for this situation.
9. Minimum cover (minimum depth of cover over the top of the sewer). The Minimum depth of the cover is 1.5 m .
10. Minimum velocity: To prevent the deposition of solids at low wastewater flows. Use minimum velocity of $0.6 \mathrm{~m} / \mathrm{s}$ during the peak flow conditions.

## Solution:

1. Lay out the trunk sewer. Draw a line to represent the proposed sewer (Figure 5.1).
2. Locate and number of the manholes. Locate manholes at (1) change in direction, (2) change in slope, (3) pipe junctions, (4) upper ends of sewers, and (5) intervals from 50 to 60 m or less. Identify each manhole with a number.
3. Prepare a sewer design computation table. Based on the experience of numerous engineers, it has been found that the best approach for carrying out sewer computations is to use a computation table. The necessary computations for the sanitary sewer are presented in (Table 5.1). The data in the table are calculated as follow:
a. The entries in columns 1 and 2 are used to identify the line numbers and street sewer name.
b. The entries in columns 3 through 5 are used to identify the sewer manholes, their numbers and the spacing between each two manholes.
c. The entries in column 6 used unit sewage. $=(80 \% *$ future water consumption $*$ population density) by unit cubic meter per day divided area in dounum.
d. The entries in columns 7 and 8 are used tributary area, column 7 used incremental area, and column 8 used total area in dounum.
e. To calculate domestic maximum flow rates columns $9,10,11,12$ are used. Column 9 is domestic average sewage flow (unit sewage * total area), Column 10 used peak factor, Column 11 represents the Maximum domestic $(\mathrm{Q})$ in (m3/day), the value of it is obtained from multiplying column 9 by column 10. Column 12 gives the infiltration allowance, which equal ( $0.10 *$ Column 9 ).
f. The entries in columns 13 (total average flow rate) is calculated by sum the Column 9 and Column 12.
g. The entries in columns 14 (total maximum flow rate) is calculated by sum the Column 11 and Column 12.
h. The entries in column 15 are Q max separately (not cumulative).
i. By using autocad program, the elevations of Manholes have been found out using the contour lines around it.
j. Save the drawing sheet containing the line as dxf drawing sheet.

The needed tables are attached in appendix A Page 179.

## A3 S1L1

### 5.1.4 SewerCAD program works:

a. Open SewerCAD, select file $\rightarrow$ import $\rightarrow$ DXF Background to import the DXF file, figure (5.2) below shows this step.

Figure (5.2) Importing DXF file
b. Specify file location is then press open, figure (5.3) below shows this step. And figure (5.4) shows line (SL1).

Figure (5.3) Opening the DXF file.

Figure (5.4) S1L1 Line.
c. Press pipe icon, a massage will appear tell you to create a project see figure (5.5).

Figure (5.5) Creating Project
d. Press yes and define the project then press next twice, then select finish, the figure (5.6) below show this step.

Figure (5.6) Defining the project
e. Press pipe icon and connect between manholes, figure (5.7) below shows the step.

Figure (5.7) Creating a pipe network.
f. After you connect between all manholes, press on the out let icon and click on the last manhole, then press yes to replace the manhole with outlet, the figure (5.8) below shows the step.

Figure (5.8) Creating outlet
g. Save your project, then select analysis $\rightarrow$ alternatives $\rightarrow$ physical properties $\rightarrow$ edit, then start editing gravity pipe, see figure (5.9).

Figure (5.9) Editing design parameters
h. Select manhole to enter the ground elevations of manholes, then select out let to enter its elevation. Then press close. Figure (5.10) below shows the step.

Figure (5.10) Editing design parameters
i. Select sanitary (dry weather) $\rightarrow$ edit $\rightarrow$ manhole to select the type of load and to enter the load for each manhole, figure (5.11) below shows the step.

Figure (5.11) Editing design parameters
j. After doing this for each manhole press close, then select design constrains $\rightarrow$ edit to enter the design specifications, figure(5.12) below shows the step.

Figure (5.12) Editing design parameters
k. Last step press save, press GO button to start design then press on GO, figure (5.13) below shows the step.

Figure (5.13) checking the design

1. If you have green light that mean there is no problems in the design work, but if you have yellow or red light that's mean there is problem, read the massages and fix these problems.
m . After finishing design work we need to show the pipe line profile and the profile, gravity pipe report and gravity node report. Press profile button to make the profile see fig (5.14), here we should put the scale of the profile. The profiles for this project are attached in appendix C. We can get the required tables by pressing tabular report button see figure (5.15), and then choose gravity pipe report and gravity node report. The required reports for this project are attached in appendix A page (190).

Figure (5.14) Creating Profile

Figure (5.15) Creating Tables

### 5.2 Storm Water Drainage System

### 5.2.1 General:

In this section, design of storm water drainage system for the Al-Arroub, in order to solve the problem causes by the cumulative flooded storm water in the streets.

In this section, the layout of the system established will be presented followed by discussion of detailed design computations and the final design and profiles of the suggested storm water drainage system.

### 5.2.2 Layout of the System:

The first step in designing a storm water drainage system is to establish an overall system layout that includes a plan of the area, showing roads, streets, buildings, other utilities, and topography.

In suggesting the layout of storm water drainage system for the Al-Arroub camp area, the following basic steps were followed:

1. Obtain a topographic map of the area to be served.
2. Locate the catchment of the site and determine the area of this catchment.
3. Sketch in preliminary closed pipe system to serve the area.
4. Sewer layout is followed natural drainage ways so as to minimize excavation and pumping requirements.
5. Establish preliminary pipe diameter that can drain the required water runoff.
6. Revise the layout so as to optimize flow-carrying capacity at minimum cost.

The final layout of storm water drainage system for Al-Arroub camp is illustrated in drawing (D4, D5) in Appendix B.

### 5.2.3 Design Computation:

The detailed design of storm water sewers involves the selection of appropriate pipe diameters and slopes to transport the quantity of storm water from the surrounding and upstream areas to the next pipe in series, subject to the appropriate design constrains. The design computations and procedure
for design storm water drainage system for Al-Arroub camp using sewerCAD is illustrated in the design example given below.

## - Design Example: Design a gravity flow storm water drainage pipe:

Design a gravity flow storm water drainage pipe for the area AL-Arroub camp line1 shown in the accompanying (Figure 5.14). Assume that the following design criteria have been developed and adopted based on an analysis of local conditions and codes.

1. For weighted Runoff coefficient (C) use 0.3.
2. For Inlet time ( Ti ) use 5 minutes
3. For Concentration time $\left(\mathrm{T}_{\mathrm{c}}\right)$ use equations

$$
\begin{equation*}
\mathrm{T}_{\mathrm{c}}=\mathrm{t}_{\mathrm{i}}+\mathrm{t}_{\mathrm{f}} \tag{4.5}
\end{equation*}
$$

4. For Runoff rate depending on the formula:

$$
\begin{equation*}
Q=C . i . A \tag{4.3}
\end{equation*}
$$

5. For Rainfall intensity use (Figure 5.16).

Figure 5.16 rainfall intensity

## Solution:

1. Lay out the storm water sewer line. Draw a line to represent the proposed sewer (See Figure 5.17)
2. Locate and number the upper and lower points of the line.
3. The necessary computations for the storm water sewer shown in Figure presented in the (Table 5.2). The data in the table are calculated as follow:
4. The entries in columns 1 through 5 are used to identify the point locations, their numbers and the length between them.
a. The entries in columns 6 and 7 represent tributary area; shows the partial sewered area in hectare.
b. The entries in columns 8 through 14 are used to calculate the design flow. Runoff coefficient (C) is entered in column 8.
c. The partial sewered area in hectare is multiplied by runoff coefficient $(\mathrm{C})$ and the result is given in column 9
d. The cumulative multiplication of the sewered area in hectare is multiplied by runoff coefficient (C) are given in column 10 .
e. The concentration time is shown in column 11
f. The rainfall intensity ( $\mathrm{mm} / \mathrm{hr}$ ) is shown in column 12
g. The rainfall intensity (1/s.ha) is shown in column 13 its calculated by dividing column 12 over 60 minutes and then multiplying by 166.67
h. Column 14 shows run off rate (Q) which obtained by multiply column 10 by column 13
i. Column 15 shows (Qi) in ( $1 / \mathrm{s}$ ) separately between two inlets.

A3 storm water line 1 fig(5.17)

## WATER TABLE (5.2)

## 5. 2.4 SewerCAD program works:

To design the storm water network on sewerCAD program we repeat the same steps as sanitary design example, but in step of design constrains enter the specifications of storm water system design.

The profiles for storm water network are attached in appendix C, and the gravity pipe reports and gravity nod reports are attached in appendix A page (215).

### 5.3 Analysis and Adjust Traverse Network

### 5.3.1 General:

Traversing is one of the simplest and most popular methods of establishing control networks in engineering surveying. In underground mining it is the only method of control applicable whilst in civil engineering it lends itself ideally to control surveys where only a few intervisible points surrounding the site are required.

### 5.3.2 Traverse Adjustment:

This project used a link traverse, because it's the most accurate traverse.

## Link traverse adjustment:

A link traverse (Figure 5.18) commences from known stations, GPS.1and GPS.2, and connects to known stations GPS. 3 and GPS.4.Stations GPS.1, GPS.2, GPS3 and GPS.4are usually fixed to a higher order of accuracy. Their values remain unaltered.

Figure (5.18) Link Traverse adjustments

Where:
GPS.1, GPS.2, GPS. 3 and GPS. 4 control point (Known Coordinates) (Trimble GPS) were used in readings of four control points (tow in the beginning and tow at the end of the traverse), then (Total Station) was used to measure horizontal distance and horizontal angle see figure (5.16).

### 5.3.3 Observations:

Table (5.3) show the observations of angles and distances that measured in project area, Were horizontal distances measured three times, and horizontal angles measured three times face right and three times face left to achieve high accuracy.

Table (5.3) Observations of Link Travers

| F.R GPS2 |  |  |  |  |

| $\mathbf{2}$ | GPS3 | 174 | 07 | 0.67 | $\mathbf{2 0 7 . 3 4 5}$ |
| GPS3 | 2 | 0 | 0 | 0 |  |
| GPS3 | GPS4 | $\mathbf{1 6 9}$ | $\mathbf{0 1}$ | $\mathbf{1 5 . 3 3}$ | $\mathbf{1 4 7 . 2 1 4}$ |

### 5.3.4 Coordinates Determination for unknown stations before correction:

* Coordinate calculation before correction:

1. Azimuth calculation:

$$
\begin{equation*}
{ }_{A, B}=\tan ^{-1} \frac{\Delta E}{\Delta N}+C \tag{5.1}
\end{equation*}
$$

- Example:

$$
\begin{aligned}
& \text { AZ } Z_{\text {GPS. } 2-\mathrm{GPS} .1}=\tan ^{-1} \frac{\mathrm{X}_{1}-\mathrm{X} 2}{\mathrm{Y}_{1}-\mathrm{Y} 2}+\mathrm{K} \\
& \quad=\tan ^{-1} \frac{162681.28-162739.007}{114750.128-114646.713}=330^{\circ} 49^{\prime} 45.9^{\prime \prime}
\end{aligned}
$$

See appendix A page (230)

2. Uncorrected coordinate calculation :

- $\Delta$ Easting $=$ Horizontal Distance $* \operatorname{Sin}$ (Azimuth)
- $\Delta$ Northing $=$ Horizontal Distance $* \operatorname{Cos}$ (Azimuth)

Easting B (unknown) $=$ Easting A (known) $+\Delta$ Easting.
Northing B (unknown) $=$ Northing $A($ known $)+\Delta$ Northing.
Example for station 1:

$$
\begin{aligned}
\Delta \text { Easting } & =191.225 * \operatorname{Sin}\left(145^{\circ} 3^{\prime} 15 "\right) \\
& =109.53 \mathrm{~m}
\end{aligned}
$$

$\Delta$ Northing $=191.225 * \operatorname{Cos}\left(145^{\circ} 3^{\prime} 15{ }^{\prime \prime}\right)$

$$
=-157.17 \mathrm{~m} .
$$

$$
X 1_{0}=162739.0078+109.53
$$

$$
=162848.541 \mathrm{~m} .
$$

$$
\mathrm{Y} 1_{0}=114646.713+(-157.17)
$$

$$
=114489.967 \mathrm{~m}
$$

See appendix A page (230).

### 5.3.5 Traverse Error Reduction:

There are many errors to reduce in traverse working. The traverse of this project is observed by total station Leica SET 630RK.

Errors in this instrument:
1 - Distance error $= \pm(5+10 \mathrm{ppm})$
2 - Angular error $= \pm 6^{\prime \prime}$

* Types of Errors:

1. Instrument Centering error:

This error is a result of many factors like:
a. Instrument Quality.
b. Tripod Quality.
c. Observer skill.
2. Target Centering Error:

This error because the prism is not perpendicular on the ground and it's about 2 mm , and corrected by this equation:
$\sigma_{D}=\overline{\sigma_{i}^{2}+\sigma_{t}^{2}+a^{2}+D * b p p m^{2}}$
Where:
$\sigma_{D}:$ Distance Error
$\sigma_{i}:$ Instrument Cantering Error
$\sigma_{t}:$ Prism Error
$\mathrm{a} \& \mathrm{~b}$ : Instrument Factor

Example on correct of distance errors:
The distance between GPS. 2 and st 1 equal (191.225).

$$
\begin{aligned}
\sigma_{D} & =\overline{\sigma_{i}^{2}+\sigma_{t}^{2}+a^{2}+D * b p p m^{2}} \\
\sigma_{D} & =\overline{0.002^{2}+0.002^{2}+(0.003)^{2}+191.225 * 0.00001^{2}} \\
& =0.005 \mathrm{~m}
\end{aligned}
$$

Table (5.5) average distance and the errors of each one

| Line | Distance (m) | $\sigma_{D}(\mathbf{m})$ |
| :--- | :--- | :--- |
| GPS2 -ST1 | 191.225 | $\mathbf{. 0 0 5}$ |
| ST1 -ST2 | 309.875 | $\mathbf{. 0 0 5 2}$ |
| ST2 -GPS 3 | $\mathbf{2 0 7 . 3 4 5}$ | $\mathbf{. 0 0 9 2}$ |

3. Angels Reading Error:

This error is a result of tow possible factors:
a. Pointing Error.
b. Reading Error.

This error correct by this equation:
$\sigma_{a b r}= \pm \frac{2 \sigma_{D I N}}{\sqrt{\bar{n}}}$
Where:
$\sigma_{a b r}$ : Is Pointing and Reading Error.
$\sigma_{D I N}$ : Is Instrument Error.
$n$ : Is reading repetition.

This value is usually be constant and equal:

$$
\sigma_{a b r}= \pm \frac{2 * 6^{\prime \prime}}{\sqrt{3}}=6.9^{\prime \prime} .
$$

### 5.3.6 Coordinate Error correction methods:

There are many methods for coordinate correction in traverse:
a. Least Square Method.
b. Linear and Angular Misclosure Method.
c. Compass Rule.

The method that will be use is least square method because it's more accurate than other methods, least square method correct the error for each coordinate and show the confidante level in traverse. The corrected coordinates are measured using least square by deferent ways:

1- Autodesk land desktop 2006 program.
2- Adjust program.
3- Manually.

The following table represents the corrected coordinates by different ways:

| Table (5.6) Corrected coordinates |  |  |
| :---: | :---: | :---: |
| 1.Autodesk 2006 method |  |  |
| Station | Easting $(\mathrm{m})$ | Northing (m) |
| St.1 | 162848.5251 | $\mathbf{1 1 4 4 9 0 . 0 3 1 7}$ |
| St.2 | 163139.5154 | $\mathbf{1 1 4 3 8 3 . 7 1 3 1}$ |
| 2. Adjust program method |  |  |
| Station | Easting $(\mathrm{m})$ | Northing (m) |
| St.1 | $162,848.538$ | $\mathbf{1 1 4 , 4 8 9 . 9 7 2}$ |
| St.2 | $163,139.537$ | $\mathbf{1 1 4 , 3 8 3 . 6 9 3}$ |
| Station | 3.Manually | Northing (m) |
| St.1 | Easting $(\mathrm{m})$ | $\mathbf{1 1 4 4 8 9 . 8 5 4 9}$ |
| St.2 | 162848.3866 | $\mathbf{1 1 4 3 8 3 . 1 0 9 6}$ |

Coordinates in table (5.6) are corrected according to known coordinates taken by GPS, and table (5.7) represents the known coordinates.

See appendix A page (232)
Table (5.7) known coordinates by GPS

| Station | Easting (m) | Northing (m) |
| :---: | :---: | :---: |
| GPS. 1 | 162681.28 | 114750.128 |
| GPS. 2 | 162739.007 | 114646.713 |
| GPS.3 | 163340.474 | 114332.926 |
| GPS.4 | 163487.363 | 114324.717 |

### 5.3.7 Soil tests:

### 5.3.7.1 Proctor compaction Test

## INTRODUCTION:

Compaction is one kind of densification that is realized by rearrangement of soil particles without outflow of water .It is realized by application of mechanic energy It does not involved fluid flow, but with moisture changing altering.

## COMPACTION EFFECT:

There are four factors affecting the extent of compaction:
1- Compaction effort.
2- Soil type and gradation.
3- Moisture content.
4- Dry unit weight (dry density).

## OBJECTIVES:

The main purpose of conducting the compaction test is to determine the maximum dry unit weight of soil .After determine the maximum dry unit weight ,specification can be determined for field compaction of the soil. Soils are compacted for the following reasons:

1- To increase strength and stability
2- To decrease permeability
3- To enhance resistance to erosion
4- Decrease compressibility under load and minimize settlement.

EQUIPMENTS:
1- Compaction mold.
2- No. 4 sieve
3- Standard Proctor hammer (5.5 Ib $\backslash 24.5 \mathrm{~N})$ )
4- Balances ( 0.1 g sensitively).
5- Moisture cans.
6- Dry oven.
7- Graduated cylinder.
8- Mixing pan.
9- Straight edge.

## PROCEDURE:

1- Obtain an air -dried soil in the mixing pan, break all the lumps so that its passes No. 4 sieve.
2- Add approximate amount of water to increase the moisture content by about $5 \%$.
3- Determine the weight of empty proctor mold without the base plate and collar (W1).
4- Place the first portion of the soil in the Proctor mold as explained a class and compact the layer applying 25 blows.

5- Scratch the layer with a spatula forming a grid to ensure uniformity in distribution of compaction energy to the subsequent layer .Place the second layer, apply 25 blows, place the last portion and apply 25 blows.
6- The final layer should ensure that the compacted soil is just above the rim of the compaction mold when the collar is still attached.
7- Determine the weight of the mold with the moist soil (W2).Extrude the sample and break it to collect the sample for water content determination preferably from the middle of the specimen.
8- Weight an empty moisture can (W3) and weight again with the moist soil obtained from the extrude sample in step 7 (W4), keep this can in the oven for water content determination.
9- After 24 hours recover the sample in the oven and determine the weight (W5).
10 - Fill out the following table completely.

## CALCULATION:

## A. SUBGRADE LAYER:

1. Water Content for a given test:

$$
\begin{align*}
\mathrm{Wc} & =\frac{\text { weight of water }(\mathrm{gm})}{\text { weight of dry soil }(\mathrm{gm})} \\
& =\frac{W 4-\mathrm{W} 5}{\mathrm{~W} 5-\mathrm{W}} \tag{5.4}
\end{align*}
$$

2. Moist unit weight for a given test:

$$
\begin{align*}
\gamma \text { moist } & =\frac{\text { weight of moist soil }(\mathrm{gm})}{\text { volume of mould }} \\
& =\frac{\mathrm{W} 2-\mathrm{W} 1}{1 / 30} \tag{5.5}
\end{align*}
$$

3. Dry unit weight for a given test:

$$
\begin{equation*}
\gamma d r y=\frac{\gamma \text { moist }}{1+\mathrm{w} \%} \tag{5.6}
\end{equation*}
$$

- Weigh of dry soil $=5 \mathrm{~kg}$.
- volume of mould $=944 \mathrm{~cm}^{3}$

Table (5.8): Proctor test output.

| TEST NUMBER | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Wc \% | 5.8 | 8.9 | 11.7 | 14.6 | 18.5 |
| W1(gm) | 3319 | 3319 | 3319 | 3319 | 3319 |
| W2(gm) | 4864.3 | 5044.3 | 5121.7 | 5208 | 5161.6 |
| W2-W1(gm) | 1545.3 | 1725.3 | 1802.7 | 1889 | 1842.6 |
| $\gamma$ moist $(\mathrm{gm}$ <br> $\left./ \mathrm{cm}^{3}\right)$ | 1.64 | 1.83 | 1.91 | 2 | 1.95 |
| $\gamma d r y$ <br> $\left(\mathrm{gm} / \mathrm{cm}^{3}\right)$ | 1.55 | 1.68 | 1.71 | 1.74 | 1.64 |

Figure (5.19): Relationship between water content and maximum dry density

- Maximum dry density $=1.73\left(\mathrm{gm} / \mathrm{cm}^{3}\right)$
- Optimum moisture content $=14 \%$

## B. BASECOARSE LAYER:

Table (5.9): basecoarse layer tests output

| TEST NUMBER | $\mathbf{1}$ | $\mathbf{2}$ | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: |
| W \% | 9 | 11 | 15 | 19 |
| W1(gm) | 3323 | 3323 | 3323 | 3323 |

Figure (5.20) Relationship between Water Content and Maximum Dry Density

- Maximum dry density $=1.975\left(\mathrm{gm} / \mathrm{cm}^{3}\right)$
- Optimum moisture content $=10.3 \%$

### 5.3.7.2 California Bearing Ratio (CBR)

## DEFINITION:

The California Bearing Ratio (CBR) test was developed by the California division of Highway as method of classifying and evaluating soil-sub grade and base course materials for flexible pavement. CBR test, an empirical test, has been used to determine the material properties for pavement design. Empirical tests measure the strength of the material and are not a true representation of the resilient modulus .It is penetration test wherein a standard piston, having an area of $3 \mathrm{in}^{2}$, is used to penetrate the soil at a standard rate of $1.25 \mathrm{~mm} \backslash \mathrm{~min}$. The pressure up to a penetration of 1.25 mm and it is ratio to the bearing value of a standard crushed rock is termed as the CBR.

## OBJECTIVES:

The CBR test to determine the relative bearing ratio and expansion characteristic under known surcharge weights of base, sub-base and sub grade soils for the design of roads, pavement and runways .The CBR test is used extensively in selection of materials and control of sub grade to determine the CBR value of the sub grade soil.

## EQUIPMENTS:

1. Loading machine -any compression machine can operate at constant rate of 1.25 mm per minute can be used.
2. Cylindrical moulds - moulds of 150 mm diameter and 175 mm height provided with a collar of about 50 mm length and detachable base.

PROCEDURE:

1. Take a sample of soil specimen.
2. Add water to the soil in the quantity such that optimum moisture content or field moisture content is reached.
3. Then soil and water are mixed thoroughly.
4. Spacer disc is placed over the base plate at the bottom of mould and a coarse filter paper is placed over the spacer disc.
5. The prepared soil water mix is divided into five. The mould is cleaned and oil is applied, then fill one fifth of the mould with the prepared soil.
6. Surcharge weight of 2.5 kg is placed on top surface of soil .Mould containing specimen is placed in piston on the testing machine .The penetration plunger is brought in contact with the soil and a load of 4 kg is applied so that contact between soil and plunger is established .Then dial reading are adjusted to zero .Load is applied such that penetration rate is $1.25 \mathrm{~mm} \backslash \mathrm{~min}$. Load at penetration of $0.5,1,1.5,2,2.5,3,4,5,7.5,10$ and 12.5 mm are noted.

Table (5.10) Standard load value.

| Penetration (mm) | Standard Load (kg) | Unit Standard Load (kg $\mathrm{cm}^{2}$ ) |
| :---: | :---: | :---: |
| 2.5 | 1370 | 70.35 |
| 5 | 2055 | 105.53 |
| 7.5 | 2630 | 134 |
| 10.0 | 3180 | 162 |
| 12.5 | 3600 | 183 |

The specification for California Bearing Ratio for Roads Layers in Palestine and Jordan is mentioned in table (5.11):

Table (5.11) Standard CBR values in Palestine and Jordan

| CBR\% | Layers |
| :---: | :---: |
| 8 at least | Sub Grade |
| 40 at least | Sub-base course |
| 80 at least | Base course |

## CALCULATION:

$$
\begin{equation*}
\mathrm{CBR}=\frac{\text { load carries by specimen }}{\text { Load carries by standard specimen }} * 100 \% \tag{5.7}
\end{equation*}
$$

## A. CBR for Sub grade layer:

- Weight of empty mould $=7712$ gm
- Volume of mould $=2124 \mathrm{~cm}^{3}$
- Water content $=14 \%$

Table (5.12) Subgrade Penetration Standard Value

| Penetration (mm) | Roving dial reading (1div =2.54 kg) |
| :---: | :---: |
| 0.5 | 0 |
| 1 | 27 |
| 1.5 | 71 |
| 2 | 109 |
| 2.5 | 150 |
| 3 | 187 |
| 3.5 | 224 |
| 4 | 255 |
| 4.5 | 289 |
| 5 | 324 |
| 6 | 374 |
| 7 | 426 |
| 8 | 479 |
| 9 | 529 |
| 10 | 581 |
| 11 | 631 |

- California Bearing Ratio at 2.5 mm penetration $=28 \%$
- California Bearing Ratio at 5.0 mm penetration $=40 \%$

## B. CBR for Base course layer:

Table (5.13) Base course Penetration standard Value

| Penetration (mm) | Roving dial reading (1div =2.54 kg) |
| :---: | :---: |
| 0.5 | 0 |
| 1 | 74 |
| 1.5 | 250 |
| 2 | 480 |
| 2.5 | 640 |
| 3 | 792 |
| 3.5 | 930 |
| 4 | 1030 |
| 4.5 | 1130 |
| 5 | 1227 |
| 5.5 | 1310 |
| 6 | 1382 |
| 6.5 | 1455 |
| 7 | 1527 |
| 7.5 | 1598 |
| 8 | 1665 |
| 8.5 | 1730 |

- California Bearing Ratio at 2.5 mm penetration $=119 \%$
- California Bearing Ratio at 5.0 mm penetration $=152 \%$
- The used value of CBR is $100 \%$.

### 5.3.8 Adjustment of Periodic Counts:

Expansion factors, used to adjust periodic counts, are determined either from continuous count stations or from control count stations.
Expansion factors from Continuous Count Stations. Hourly, daily, and monthly expansion factors can be determined using data obtained at continuous count stations.

1. Hourly Expansion Factor (HEF) is determined by the formula:

$$
\begin{equation*}
H E F=\frac{\text { total volume for 24-hr period }}{\text { volume for particular hour }} \tag{5.8}
\end{equation*}
$$

These factors are used to expand counts of durations shorter than 24 hour to 24 -hour volumes by multiplying the hourly volume for each hour during the count period by the HEF for that hour and finding the mean of these products.

Table (5.14) Hourly Expansion Factors for Rural Primary Road

| Hour | HEF | Hour | HEF |
| :---: | :---: | :---: | :---: |
| 6:00-7:00 a.m. | 42 | $06: 00-07 \mathrm{p} . \mathrm{m}$ | 16.62 |
| 7:00-8:00 a.m. | 29 | $07: 00-08 \mathrm{p} . \mathrm{m}$ | 17.49 |
| 8:00-9:00 a.m. | 22.5 | $08: 00-09 \mathrm{p} . \mathrm{m}$ | 20.38 |
| 9:00-10:0 a.m | 18.8 | $09: 00-10 \mathrm{p} . \mathrm{m}$ | 25.26 |
| 10:00-11 a.m | 17.1 | $10: 00-11 \mathrm{p} . \mathrm{m}$ | 31.19 |
| 11:00-12 p.m | 18.52 | $11: 00-12$ a.m | 34.31 |
| 12:00-01 p.m | 18.71 | $12: 00-01$ a.m | 51.24 |
| $01: 00-02 \mathrm{p} . \mathrm{m}$ | 16.71 | $01: 00-02$ a.m | 82.33 |
| $02: 00-03 \mathrm{p} . \mathrm{m}$ | 14.84 | $02: 00-03 \mathrm{a} . \mathrm{m}$ | 123.5 |
| 03:00-04 p.m | 14.77 | $03: 00-04 \mathrm{a} . \mathrm{m}$ | 137.22 |

| $04: 00-05 \mathrm{p} . \mathrm{m}$ | 12.85 | $04: 00-05 \mathrm{a} . \mathrm{m}$ | 143.6 |
| :---: | :---: | :---: | :---: |
| $05: 00-06 \mathrm{p} . \mathrm{m}$ | 13.85 | $05: 00-06$ a.m | 90.14 |

2. Daily expansion factor (DEF) is computed as:

$$
\begin{equation*}
D E F=\frac{\text { average total volume for week }}{\text { average volume for particular day }} \tag{5.9}
\end{equation*}
$$

This factor is used to determine weekly volumes from counts of 24 -hour duration by multiplying the 24 -hour volume by the DEF.

Table (5.15) Daily Expansion Factor for Rural Primary Road

| Days of weeks | DEF |
| :---: | :---: |
| Sunday | 9.515 |
| Monday | 7.012 |
| Tuesday | 7.727 |
| Wednesday | 6.582 |
| Thursday | 7.012 |
| Friday | 5.724 |
| Saturday | 6.510 |

3. Monthly expansion factor (MEF) is computed as :

$$
\begin{equation*}
M E F=\frac{\text { AADT }}{\text { ADT for particular month }} \tag{5.10}
\end{equation*}
$$

The AADT for a given year may be obtained from the ADT for a given month by multiplying this volume by the MEF.

Table (5.16) Daily Expansion Factor for Rural Primary Road

| Month | MEF |
| :---: | :---: |
| January | 1.756 |
| February | 1.975 |
| March | 1.635 |
| April | 1.481 |

| May | 1.394 |
| :---: | :---: |
| June | 0.948 |
| July | 0.578 |
| August | 0.521 |
| September | 0.6320 |
| October | .948 |
| November | 1.185 |
| December | 1.354 |

- In these case the count of vehicle as shown: The data are collected on a Thursday during March.

Table (5.17) Vehicle number

| Hours | Number of vehicle |
| :---: | :---: |
| $10.00-11: 00$ a.m | 75 |
| $11: 00-12: 00 \mathrm{a} . \mathrm{m}$ | 81 |
| $12: 00-01: 00 \mathrm{p} . \mathrm{m}$ | 73 |

- Estimate the 24-hr volume for Thursday using the factors given in Table (5.11)

$$
A D T=\frac{75 * 17.1+81 * 34.31+73 * 18.71}{3}=1833
$$

- Adjust the $24-\mathrm{hr}$ volume for Thursday to an average volume for the week using the factors given in Table (5.15)

$$
\begin{aligned}
\text { Total } 7 \text {-day volume }= & 1382 * 7.012 \\
& =12852
\end{aligned}
$$

$$
\begin{gathered}
A W T=9691 \backslash 7 \\
=14 \prime 32
\end{gathered}
$$

- Since the data were collected in March, use the factor shown for March in Table (5.16) to obtain the AADT.

$$
\begin{aligned}
& A A D T=1836 * 1.635 \\
& =3002
\end{aligned}
$$

- Computation the numbers of lane:

$$
\begin{aligned}
\text { Number of lane } & =\frac{\text { AADT }}{\text { Saturation }} \\
& =\frac{2263}{1500} \\
& =2
\end{aligned}
$$

- Then the number of lane in these case equal 2 lanes in two directions.

### 5.3.9 Structural Design of the Road

$E S A L=f_{d} \times G_{f} \times A A D T \times 365 \times N_{i} \times f_{E}$
ESAL: Equivalent Accumulated 18,000 Ib Single Axle Load
$\mathrm{F}_{\mathrm{d}:}$ design lane factor.
$\mathrm{G}_{\mathrm{f}}$ : growth factor.
AADT: first year annual average daily traffic.
Ni : number of axles on each vehicle.
fe: load equivalency factor.

- We get fd from table(5.18)

Table (5.18) Percentage of Total Truck Traffic in Design Lane

| Number Of Traffic Lanes <br> ( Two Directions) | Percentage Truck in Design Lane (\% |
| :---: | :---: |
| 2 | $\mathbf{5 0}$ |
| $\mathbf{4}$ | $\mathbf{4 5 ( 3 5 - 4 8 )}$ |
| $\mathbf{6}$ or more | $\mathbf{4 0 ( 2 5 - 4 8 )}$ |

- $\mathrm{Fd}=0.50$ for Truck
- $\mathrm{Fd}=0.10$ for Passenger car
- We get Growth factor (Gjt)from table(5.19)

Table (5.19) Growth rate factor.

| Design <br> period <br> years | Annual Growth Rate (\%) <br> growth | 2 | 4 | 5 | 6 | 7 | 8 | $\mathbf{1 0}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | $\mathbf{1 . 0}$ |
| 2 | 2.0 | 2.02 | 2.04 | 2.05 | 2.06 | 2.07 | 2.08 | $\mathbf{2 . 1 0}$ |
| 3 | 3.0 | 3.06 | 3.12 | 3.15 | 3.18 | 3.21 | 3.25 | $\mathbf{3 . 3 1}$ |
| 4 | 4.0 | 4.12 | 4.25 | 4.31 | 4.37 | 4.44 | 4.51 | $\mathbf{4 . 6 4}$ |
| 5 | 5.0 | 5.20 | 5.42 | 5.53 | 5.64 | 5.75 | 5.87 | $\mathbf{6 . 1 1}$ |
| 6 | 6.0 | 6.31 | 6.63 | 6.80 | 6.98 | 7.15 | 7.34 | $\mathbf{7 . 7 2}$ |
| 7 | 7.0 | 7.43 | 7.90 | 8.14 | 8.39 | 8.65 | 8.92 | $\mathbf{9 . 4 9}$ |
| 8 | 8.0 | 8.58 | 9.21 | 9.55 | 9.90 | 10.26 | 10.64 | $\mathbf{1 1 . 4 4}$ |
| 9 | 9.0 | 9.75 | 10.58 | 11.03 | 11.49 | 11.98 | 12.49 | $\mathbf{1 3 . 5 8}$ |

| 10 | 10.0 | 10.95 | 12.01 | 12.58 | 13.18 | 13.82 | 14.49 | $\mathbf{1 5 . 9 4}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 11 | 11.0 | 12.17 | 13.49 | 14.21 | 14.97 | 15.78 | 16.65 | $\mathbf{1 8 . 5 3}$ |
| 12 | 12.0 | 13.41 | 15.03 | 15.92 | 16.87 | 17.89 | 18.98 | $\mathbf{2 1 . 3 8}$ |
| 13 | 13.0 | 14.68 | 16.63 | 17.71 | 18.88 | 20.14 | 21.50 | $\mathbf{2 4 . 5 2}$ |
| 14 | 14.0 | 15.97 | 18.29 | 19.16 | 21.01 | 22.55 | 24.21 | $\mathbf{2 7 . 9 7}$ |
| 15 | 15.0 | 17.29 | 20.02 | 22.58 | 23.28 | 25.13 | 27.15 | $\mathbf{3 1 . 7 7}$ |
| 16 | 16.0 | 18.64 | 21.82 | 23.66 | 25.67 | 27.89 | 30.32 | $\mathbf{3 5 . 9 5}$ |
| 17 | 17.0 | 20.01 | 23.70 | 25.84 | 2.21 | 30.48 | 33.75 | $\mathbf{4 0 . 5 5}$ |
| 18 | 18.0 | 21.41 | 25.65 | 28.13 | 30.91 | 34.00 | 37.45 | $\mathbf{4 5 . 6 0}$ |
| 19 | 19.0 | 22.84 | 27.67 | 30.54 | 33.76 | 37.38 | 41.45 | $\mathbf{5 1 . 1 6}$ |
| 20 | 20.0 | 24.30 | 29.78 | 33.06 | 36.79 | 41.00 | 45.76 | $\mathbf{5 7 . 2 8}$ |
| 25 | 25.0 | 32.03 | 41.65 | 47.73 | 51.86 | 63.25 | 73.11 | $\mathbf{9 8 . 3 5}$ |
| 30 | 30.0 | 40.57 | 56.08 | 66.44 | 79.05 | 94.46 | 113.28 | $\mathbf{1 6 4 . 4 9}$ |
| 35 | 35.0 | 49.99 | 73.65 | 90.32 | 111.43 | 138.24 | 172.32 | $\mathbf{2 7 1 . 0 2}$ |

- Growth rate equal 5\% for all vehicle.
- The design period 20 years.
- The Growth factor (Gjt) equal 33.06 from table (5.19).
- $\quad$ passenger car $(1 \mathrm{kips} / \mathrm{axle})=90 \%$
- 2 single axle. unit truck ( $6 \mathrm{kips} / \mathrm{axle}$ ) $=8 \%$
- 3 single axle. unit truck ( $10 \mathrm{kips} /$ axle $)=2 \%$
- We get load equivalency factor for axle load (fE)from table(5.20)

Table (5.20) Axle load equivalent factor.

| Gross Axle Load | Load <br> factor | Equivalency | Gross Axle Load | Load <br> factor | Equivalency <br> KN | lb | Single <br> Axle |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Tandem <br> Axle | KN | lb | Single <br> Axle | Tandem <br> Axle |  |  |
| 4.45 | 1,000 | 0.00002 |  | 182.5 | 41,000 | 23.27 | $\mathbf{2 . 2 9}$ |

| 178.0 | 40,000 | 21.08 | 2.08 | 365.0 | 80,000 | $\mathbf{2 8 . 9 9}$ |

- Load equivalency factor for Passenger cars $(\mathrm{fEi}(\mathrm{car}))=0.00002$
- Load equivalency factor for 2 single axle $(\mathrm{fEi}($ Truck $))=0.01043$
- Load equivalency factor for 3 single axle $(\mathrm{fEi}($ Truck $))=0.0877$
- ESAL (Passenger car) $=3002 * 0.90 * 365 * 0.00002 * 0.1 * 33.06 * 2$

ESAL $($ Passenger car $)=130.4$

- ESAL ( 2 axles. single unit truck $)=3002 * 0.08 * 365 * 0.01043 * 0.50 * 33.06 * 2$

ESAL $(2$ axles. single unit truck $)=30226$

- ESAL (3 axles. single unit truck $)=3002 * 0.02 * 365 * 0.0877 * 0.50 * 33.06 * 3$

ESAL ( 3 axles. single unit truck $=95307.53$

- Total ESAL =125664.
- Design a flexible pavement for urban Local street using 1993 AASHTO, after take these information:
- ESAL equal 125664.
- Take a 1 day for water to remove.
- Saturation became during $30 \%$ of time.
- Materials:

1. Elastic modulus for HMA at $68^{\circ} \mathrm{F}$ equal 450 ksi . Show figure (5.21)
2. CBR for base layer equal $100 \%$, the value of resilient modulus equal 31 ksi . from chart (5.22)
3. CBR for subgrade layer equal $40 \%$ (from these value, subgrade layer can be used as sub base layer). Show figure (5.23)

The value of Mr for subgrade when $\mathrm{CBR}>10$ is calculated by
$\mathrm{Mr}=3000 * \mathrm{CBR}^{0.65}$
$\mathrm{Mr}=3000 * 40^{0.65}=32996 \mathrm{psi}$
When Mr greater than 15000 psi it multiplied by adjustment factor equal 0.33 .
$\mathrm{Mr}=32996^{*} 0.33=10888.6 \mathrm{psi}=10.8 \mathrm{ksi}$
4. Standard deviation (So) equal 0.5.

Table (5.21) standard deviation

| Pavement | Standard Deviation, So |
| :--- | :--- |
| Flexible pavements | $0.40-0.50$ |
| Rigid pavements | 0.30 |

5. The value of $\mathrm{PSI}=\mathrm{pi}-\mathrm{pt}$
pt: terminal serviceability index pi: initial serviceability index

When pi equal 4.5, and pt equal 2.5
PSI $=2$
pt : terminal serviceability index
pi: initial serviceability index

### 5.3.10 Design the Thickness of Layers

Table (5.22) reliability level

| Recommended Level of Reliability |  |  |
| :--- | :--- | :--- |
|  |  |  |
| Functional Classification | Urban | Rural |
| Interstate and other freeways | $85-99.9$ | $80-99$ |
| Other principal arterials | $80-99.9$ | $75-95$ |
| Collectors | $80-95$ | $75-95$ |
| Local | $50-80$ | $50-80$ |

- The value of the Reliability equal 80

Figure (5.21) Charts for Estimating Structural Layer Coefficient of Dense-Graded/Asphalt

- Concrete Based on the Elastic (Resilient) Modulus for asphalt is 400ksi
- The value of Structure layer coefficient (a1) for Asphalt equal 0.44

Figure (5.22) Variation in Granular Base Layer Coefficient, $a 2$, with Various Subbase Strength Parameters

- The value of Structural coefficient (a2) for base layer equal 0.14

Figure (5.23) Variation in Granular Subgrade Layer Coefficient, a3, with Various Subgrade Strength Parameters

Table (5.23) Definition of Drainage Quality

| Quality of Drainage | Water Removed Within* |
| :---: | :---: |
| Excellent | 2 hours |
| Good | 1 day |
| Fair | 1 week |
| Poor | 1 month |
| Very poor | (water will not drain) |

- The quality of drainage is good.

Table (5.24) Recommended $m i$ Values

| Percent of Time Pavement Structure Is Exposed to <br> Moisture Levels Approaching Saturation |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Quality of <br> Drainage | Less than 1\% | 1 to $5 \%$ | 5 to $25 \%$ | Greater <br> Than $25 \%$ |
| Excellent | $1.40-1.35$ | $1.35-1.30$ | $1.30-1.20$ | 1.20 |
| Good | $1.35-1.25$ | $1.25-1.15$ | $1.15-1.00$ | 1.00 |
| Fair | $1.25-1.15$ | $1.15-1.05$ | $1.00-0.80$ | 0.80 |
| Poor | $1.15-1.05$ | $1.05-0.80$ | $0.80-0.60$ | 0.60 |
| Very poor | $1.05-0.95$ | $0.95-0.75$ | $0.75-0.40$ | 0.40 |

- at $30 \%$ of time pavement structure is exposed to moisture levels approaching saturation ,then the value of :
- $m i=1$
- $\mathrm{m} 1=\mathrm{m} 2=1$.
$\qquad$

Figure (5.24) The structure number above each of two layers is determined from figure (5.25)

Figure (5.25) Design Chart for Flexible Pavements Based on Using Mean Values for each Input

- $\quad$ SN2 (above subgrade layer) $=2.89$
- $\quad$ SN1 (above base layer) $=1.34$
$\mathrm{D} 1=\frac{\mathrm{SN} 1}{\mathrm{a} 1}=\frac{1.34}{0.44}=3.05$
$D 1^{*}=4^{\prime \prime}$

$$
\begin{aligned}
& \mathrm{SN} 1^{*}=\mathrm{a} 1 * \mathrm{D} 1^{*}=0.44 * 4=1.76 \\
& \mathrm{D} 2^{*} \geq \frac{\mathrm{SN} 2-\mathrm{SN} 1^{*}}{\mathrm{a} 2 * \mathrm{~m} 2} \\
& \mathrm{D} 2^{*} \geq \frac{2.89-1.76}{0.14 * 1}=8.07 \\
& \mathrm{D} 2^{*}=10^{\prime \prime} \\
& \mathrm{SN} 2^{*}=\mathrm{a} 1 * \mathrm{D} 1^{*}+\mathrm{a} 2 * \mathrm{~m} 2 * \mathrm{D} 2^{*} \\
& =0.44 * 4+0.14 * 1 * 12=3.4
\end{aligned}
$$

- $\mathrm{SN}^{*}>$ SN2
- Then the design is correct.

Table (5.25) HMA and Base Coarse layer thick

| Layer | Thickness (in) |
| :---: | :---: |
| HMA surface | 4 |
| Base coarse | 10 |

# CHAPTER SIX 

CONCLUSION

## Conclusion

In the project an attempt is made to evaluate the existing infrastructure in the Palestinian camp and to design the most important part of the physical infrastructure. The main conclusion drawn from the present study are:-

1- The Palestinian refugees lived and still living in the camps, since 1948 , most of the situations in their regarding to the environmental issue, social issues and other issued needs to be looked and discussed carefully

2- All the camps have almost the same problems.
3- The water consumption in the camps is too little; it is ranged between ( $65-80$ ) letters per capita per day.

4- Many camps have a part of infrastructure which is in very bad condition and on absenceof engineering standards, the others have no infrastructure.

5- A trial is made to design a wastewater collection system, storm water drainage system and road design which serve all of AL-Arroub camp.

6- The flow in wastewater collection system and storm water drainage system is going by gravity.

## APPENDIX

(A)

- WASTE WATER QUANTITY TABLES
- STORM WATER QUANTITY TABLE
- TRAVERSE ADJUSTMENT REPORTS

## First: Waste water quantity calculation

Example on calculation of waste water quantity for manhole number 1 to manhole number 2 :

- Unit sewage $=$ waste water $*$ Pop density
- Waste water $=0.8^{*}$ water consumption

$$
=0.8 * 120 / 1000
$$

* Waste water $=0.096 \quad \mathrm{~m}^{3}$ c.day
- Pop density $=\frac{\text { population }}{\text { Area }}$
- Population growth $=3.35 \%$

$$
P_{f}=P_{p} \quad 1+\frac{r}{100}^{4}
$$

Pop $2011=10444\left(1+\frac{3.35}{100}\right)^{4}$
Pop 2011= 11915person
Pop $2036=119151+\frac{3.35}{100}^{25}$
Pop $2036=27155$

- Area of camp $=426$ dounum.
- Pop density $=\frac{27155}{426}$
- Pop density $=64 \mathrm{c} /$ donum

Unit sewage $=0.096 * 64=6.11 \mathrm{~m}^{3} /$ day.dounum
The incremental area is the expected area for each manhole.
Total area is the sum of all previous manholes area.

- Q Average $=$ Unit sewage * Total Area

$$
=6.11 * 2.37
$$

- Q Average $=14.48 \mathrm{~m}^{3} /$ day
- $\quad$ Peak factor $=1.5+\frac{2.5}{\overline{\text { Qavg }}}$

Peak factor $=1.5+\frac{2.5}{\sqrt{14.48}}$
Peak factor $=2.16$
Peak factor should be less than 3
Maximum $\mathrm{Q}=$ Peak factor * Qavg

$$
\begin{aligned}
& =2.16 * 14.48 \\
& =31.27 \mathrm{~m}^{3} / \text { day }
\end{aligned}
$$

Infiltration $=0.1$ * Qavg

$$
=0.1 * 14.48
$$

Infiltration $=1.448 \mathrm{~m}^{3} /$ day
Total Average $=$ Infiltration + Qavg

$$
=1.448+14.48
$$

Total Average $=15.92 \mathrm{~m}^{3} /$ day
Total Max $=$ Infiltration +Qmax

$$
=1.448+31.27
$$

Total $\operatorname{Max}=32.718 \mathrm{~m}^{3} /$ day

## Second: Storm water quantity calculation:

Example on calculation of waste water quantity for manhole number 1 to manhole number 2 :

- Pipe length $=100 \mathrm{~m}$.
- Tributary area $=4.83 \mathrm{~m}^{2}$.
- Runoff coefficient $=\mathbf{0 . 3 0}$.
- C.A= 1.45 ha.
- $\quad \Sigma C . A=1.45$ ha.
- Concentration time (Tc) $=\mathbf{t i}+\mathbf{t f}$
- $\mathbf{t i}=\mathbf{5} \mathbf{m i n}$.
- $\mathbf{t f}=\frac{\text { Distance }}{\text { Velocity }}$.

$$
\mathbf{t f}=\frac{100}{1 * 60}=\mathbf{1 . 6 7} \mathrm{min} .
$$

- $\mathrm{Tc}=5+1.67=6.67 \mathrm{~min}$.
- Rain Fall intensity $=75 \frac{\mathrm{~mm}}{\mathrm{hr}}$.
- Rain Fall intensity $=208.8 \frac{l}{\text { s.h }}$.
- $\mathrm{Qmax}=$ C.I.A

$$
\begin{aligned}
\mathrm{Qmax} & =0.3 * 208.8 * 4.83 \\
& =301.75 \frac{\mathrm{l}}{\mathrm{~s}} .
\end{aligned}
$$

## Third: Traverse adjustment

1. The average and variance for field observation (horizontal distances and angles):
A) Horizontal angles
F.R (ST.GPS2)

| point | Horizontal Angle |  |  | Horizontal Distance m |
| :---: | :---: | :---: | :---: | :---: |
|  | d |  | " |  |
| GPS1 | 00 | 00 | 00 | 118.436 |
| ST. 1 | 174 | 13 | 41 | 191.223 |
| GPS1 | 359 | 59 | 52 | 118.440 |
| ST. 1 | 174 | 13 | 18 | 191.219 |
| GPS1 | 00 | 00 | 17 | $118 . .437$ |
| ST. 1 | 174 | 13 | 19 | 191.229 |

F.L (ST. GPS2)

| point | Horizontal Angle <br> $\mathbf{d}$ | Horizontal Distance |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | 354 | 13 | 30 | $\mathbf{m}$ |
| ST.1 | 180 | 00 | 11 | 191.226 |
| GPS1 | 354 | 13 | 35 | 118.438 |
| ST.1 | 180 | 00 | 03 | 191.225 |
| GPS1 | 354 | 13 | 55 | 118.437 |
| ST.1 | 180 | 00 | 00 | 191.227 |
| GPS1 |  |  |  | 118.438 |

- A.1.1Calculating of mean angles:

Mean direction $=\frac{(\text { Angle F.L-180) }+ \text { Angle } F . R}{2} *$

- $\xrightarrow[\text { GPS2 - GPS1 -ST1 }]{ }$
*First time:

MDGPS2-GPS1 =00 00' 05.5"

MDGPS2-ST1 = 174 13' 35.5"

Angle = 174 13' $35.5^{\prime \prime}-00$ 00' 05.5"
= 174 13' 30"
*Second time:
$\left.=\frac{\left.\left(\begin{array}{lllllll}180 & 00 & 03-180 & 00 & 11\end{array}\right)+3541335\right)-360}{2}=0000^{\prime} 08.5^{\prime \prime}=\frac{\left(\begin{array}{llll}354 & 13 & 35-180 & 00\end{array}\right)}{2}\right)+1741318$
= 174 13' 37"

Angle = 174 13' 37 " $-(0000$ '08.5" $)$

$$
\text { = } 174 \text { 13' 06.5 }
$$

*Third time:
$=\frac{\left(\begin{array}{lll}180 & 00 & 00-1800000)+000017\end{array}\right)}{2}=0000^{\prime} 03.83^{\prime \prime}$
$=\frac{\left(\begin{array}{llll}354 & 13 & 55-180 & 00 \\ 2\end{array}\right)+1741319}{2}=17413^{\prime} 37^{\prime \prime}$

Angle $=174$ 13' 37" -00 0' 00.5"

$$
=174 \quad 13^{\prime} \quad 28.5^{\prime \prime}
$$

Mean angle $=\sum \frac{\text { Anels }}{n}$
Mean $=\frac{17413 \prime 06.5^{\prime \prime+174} 13^{\prime} 30^{\prime \prime+} 17413^{\prime} 28.5^{\prime \prime}}{3}=174$ 13' 29.1"

- A.1.2 Calculating of variances:
$V=$ mean - angle
V1= 29.1"- $30=--0.9 "$

| Mean |  |  | Angle |  |  | V | V^2 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 174 | 13' | 29.1" | 174 | 13' | 30" | -0.9" | 0.81 |
| 174 | 13' | 29.1" | 174 | 13' | 29" | 0.1" | 0.01 |
| 174 | 13' | 29.1" | 174 | 13' | 28.5" | 0.6" | 0.36 |
| $\Sigma$ |  |  |  |  |  |  | 1.180 |

$S=\frac{\overline{\sum V^{2}}}{n-1}$
$S=\frac{\overline{1.180}}{2}=0.768^{\prime \prime}$

## E95=1.96*S

$\mathrm{E} 95=1.96 * 0.764=1.506$
$174 \quad 13 ' 29.1 \pm 1.506$
Range (174 13' 27.59" - 174 13' 30.61")
There is no reason to believe that any observation is a blunder or outlier.
F.R (ST.1)

| point | Horizontal Angle <br> d | $\mathbf{n}^{\prime}$ | Horizontal Distance |  |
| :--- | :--- | :--- | :--- | :--- |
| GPS2 | 00 | 00 | 00 | 191.262 |
| ST.2 | 145 | 01 | 42 | 309.873 |
| GPS.2 | 359 | 59 | 45 | 191.273 |
| ST.2 | 145 | 01 | 38 | 309.861 |
| GPS.2 | 00 | 00 | 03 | 191.254 |
| ST.2 | 145 | 01 | 35 | 309.881 |

F.L (ST.1)

| point | Horizontal Angle <br> d <br> 11 |  |  | Horizontal Distance m |
| :---: | :---: | :---: | :---: | :---: |
| ST. 2 | 325 | 01 | 29 | 309.897 |
| GPS. 2 | 179 | 59 | 53 | 191.254 |
| ST. 2 | 325 | 01 | 38 | 309.859 |
| GPS. 2 | 179 | 59 | 21 | 191.245 |
| ST. 2 | 325 | 01 | 09 | 309.876 |
| GPS. 2 | 179 | 59 | 12 | 191.244 |

- A.2.1 Calculating of mean angles:
- $\overrightarrow{\mathrm{GPS} 2-\mathrm{ST} 2-\mathrm{ST} 2}$
*First time:
MD st1 - GPS2 $=0000^{\prime} 00^{\prime \prime}$
MD st1 - st2 = 145 01' $35.5^{\prime \prime}$
Angle $=145$ 01' $35.5^{\prime \prime}-00 \quad 00^{\prime} \quad 00^{\prime \prime}$

$$
=145 \quad 01^{\prime} \quad 35.5^{\prime \prime}
$$

## *Second time:

MD st1 - st2 =-00 00' $27{ }^{\prime \prime}$
MD st $1-$ GPS2 $=145$ 01' $38^{\prime \prime}$

$$
\begin{aligned}
\text { Angle } & =145 \\
& 01^{\prime}
\end{aligned} \quad 38^{\prime \prime}-\left(\begin{array}{llll}
-00 & 00^{\prime} & 27^{\prime \prime}
\end{array}\right)
$$

*Third time:
MD st $1-$ GPS2 $=-00 \quad 00^{\prime} \quad 22.5^{\prime \prime}$
MD st $1-$ st2 $=145$ 01' $22^{\prime \prime}$

Angle $=145000^{\prime \prime} 22^{\prime \prime}-\left(\begin{array}{lll}-00 & 00^{\prime} & 22.5^{\prime \prime}\end{array}\right)$

$$
=14501^{\prime} 44.5^{\prime \prime}
$$

Mean $=\sum \frac{\text { Anels }}{n}$
Mean $=\frac{17413^{\prime} 07.5^{\prime \prime}+17413^{\prime} 06.5^{\prime \prime}+17413^{\prime} 06^{\prime \prime}}{3}=17413^{\prime} 06.67^{\prime \prime}$

- A.2.2 Calculating of variances:
- $\mathrm{V}=$ mean - angle

- $\mathrm{S}=15.119^{\prime \prime}$
- E95=1.96*S
- $\mathrm{E} 95=1.96 * 15.119=29.633$
- 145 01' $48.33 " \pm 29.633$
- Range (145 01' 18.697" - 145 02' 17.963")
- There is no reason to believe that any observation is a blunder or outlier
F.R (ST.2)

| point | Horizontal Angle <br> d |  |  | Horizontal Distance m |
| :---: | :---: | :---: | :---: | :---: |
| ST. 1 | 00 | 00 | 00 | 309.889 |
| GPS. 3 | 174 | 07 | 28 | 207.352 |
| ST. 1 | 359 | 59 | 53 | 309.888 |
| GPS. 3 | 174 | 06 | 52 | 207.359 |
| ST. 1 | 359 | 59 | 59 | 309.897 |
| GPS. 3 | 174 | 07 | 07 | 207.349 |

F.R (ST.2)

| point | Horizontal Angle <br> d | Horizontal Distance |  |  |
| :--- | :--- | :--- | :--- | :--- |
| GPS.3 | 354 | 06 | 31 | $\mathbf{m}$ |
| ST.1 | 180 | 00 | 10 | 207.351 |
| GPS.3 | 354 | 06 | 47 | 309.897 |
| ST.1 | 179 | 59 | 40 | 207.313 |
| GPS.3 | 354 | 06 | 59 | 309.876 |
| ST.1 | 179 | 59 | 58 | 207.344 |

A.3.1 calculating of means angles:

- $\overrightarrow{\text { ST1-ST2-GPS3 }}$
- MD st2-st1 = $0000^{\prime} 05^{\prime \prime}$
- MD st2 - GPS2 = 174 06' 59.5"

$$
\begin{aligned}
\text { Angle } & =17406^{\prime} 59.5^{\prime \prime}-00 \\
00^{\prime} & 05^{\prime \prime} \\
& =17406^{\prime} 54.5^{\prime \prime}
\end{aligned}
$$

## *First time:

- MD st2 - GPS2 = - 00 00' $13.5^{\prime \prime}$
- $\quad$ MD St2- st1 $=174066^{\prime \prime} 49.5^{\prime \prime}$

$$
\begin{aligned}
& \text { Angle }=174066^{\prime} 49.5^{\prime \prime}-\left(\begin{array}{lll}
-00 & 00 & 13.5 "
\end{array}\right) \\
& =174 \text { 07' 03" }
\end{aligned}
$$

## *Second time:

- MD st2 - GPS2 $=-00 \quad 00^{\prime} 01.5^{\prime \prime}$
- MD St2- stl = 174 07' 03"

Angle $=17407^{\prime} \quad 03^{\prime \prime}-\left(\begin{array}{llll}-00 & 00^{\prime} & 01.5\end{array}\right)$
$=17407{ }^{\prime} 04.5^{\prime \prime}$

## *Third time:

- MD st2-GPS2 $=-00 \quad 00^{\prime} \quad 01.5^{\prime \prime}$
- MD St2- st1 = 174 07' 03"

Angle $=174 \quad 07^{\prime} \quad 03^{\prime \prime}-\left(\begin{array}{llll}-00 & 00^{\prime} & 01.55^{\prime \prime}\end{array}\right)$
$=17407{ }^{\prime} 04.5^{\prime \prime}$.
Mean= = 174 07' 00.67" *

- A.3.2 Calculating of variances:
- $\mathrm{V}=$ mean - angle

| Mean |  |  | Angle |  |  | V |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 174 | 07' | 00.67" | 174 | 06' | 54.5" | 6.17" | 38.069 |

A.4.1 calculating of means angles:

- $\overrightarrow{\text { ST2 - GPS3 -GPS } 4}$
*First time:
- MD st2 - GPS2 = -00 00' 03"
- MD St2-st1 = $16900^{\prime} 52^{\prime \prime}$

Angle $=169 \quad 00^{\prime} \quad 29.5$ " $-\left(\begin{array}{lll}-00 & 00^{\prime} & 03 \prime\end{array}\right)$

$$
=169 \quad 00^{\prime} \quad 55^{\prime \prime}
$$

*Firsttime:

- MD st2-GPS2 $=-00$ 00' $03^{\prime \prime}$
- MD St2-st1 = 169 00' 52"

Angle $=16900^{\prime} \quad 29.5$ " $-\left(\begin{array}{lll}-00 & 00^{\prime} & 03 \prime\end{array}\right)$
$=16900^{\prime} 55^{\prime \prime}$

## *Second time:

- MD st2 - GPS2=00 00' 08"
- MD St2-st1 = 169 01' $39^{\prime \prime}$

Angle $=16901^{\prime} 16.5 "-0000 ' 00^{\prime \prime}$
$=16901^{\prime} 31^{\prime \prime}$

## *Third time:

- MD St2-st1=00 00' 09"
- MD st2 - GPS2 = 169 01' 29 "

Angle $=169$ 01' $06.5^{\prime \prime}-00 \quad 00^{\prime} \quad 09^{\prime \prime}$
$=16901^{\prime} 20^{\prime \prime}$

Mean= = 169 01' $15.33{ }^{\prime \prime}$

## A.4.2 Calculating of variances:

$\mathrm{V}=$ mean - angle

| Mean |  |  | Angle |  |  | V |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 169 | 01' | 15.33' | 169 | 00' | 55" | 20.33" | 413.309 |
| 169 | 01' | 15.33' | 169 | 01' | 31" | -15.67" | 245.549 |
| 169 | 01' | 15.33' | 169 | 01' | $20^{\prime \prime}$ | -4.67" | 21.809 |
| $\Sigma$ |  |  |  |  |  |  | 680.667 |

$\mathrm{S}=18.45^{\prime \prime}$
E95=1.96*S
E95=1.96*18.45 $=36.158^{\prime \prime}$
169 01' $15.33^{\prime \prime} \pm 36.158^{\prime \prime}$
Range (169 00' 39.17" - 169 01' 51.49")
There is no reason to believe that any observation is a blunder or outlier
B) Horizontal Distances:

## B. 1 Distance between GPS. $1 \rightarrow$ GPS. 2

Mean $==118.438 \mathrm{~m}$
$\mathrm{V}=$ mean - distance
$\mathrm{V}=118.438-118.436=0.002 \mathrm{~m}$

| Mean <br> $\mathbf{m}$ | Distance <br> $\mathbf{m}$ | V <br> $\mathbf{m m}$ | $\mathbf{m m}$ |
| :--- | :--- | :--- | :--- |
| $\mathbf{1 1 8 . 4 3 8}$ | 118.436 | 2 | $\mathbf{4}$ |
| $\mathbf{1 1 8 . 4 3 8}$ | 118.440 | -2 | $\mathbf{4}$ |
| $\mathbf{1 1 8 . 4 3 8}$ | $118 . .437$ | 1 | $\mathbf{1}$ |
| $\mathbf{1 1 8 . 4 3 8}$ | 118.438 | 0 | $\mathbf{0 . 0 0}$ |
| $\mathbf{1 1 8 . 4 3 8}$ | 118.437 | 1 | $\mathbf{1}$ |
| $\mathbf{1 1 8 . 4 3 8}$ | 118.438 | 0 | $\mathbf{0 . 0 0}$ |
| $\sum$ |  | $\mathbf{1 0}$ |  |

$\mathrm{S}==1.414 \mathrm{~mm}$
$\mathrm{E} 95=1.96 * \mathrm{~S}$
$\mathrm{E} 95=1.96 * 1.29=2.772$

## $118.438 \pm 0.00277$

Range (118.435-118.441)
There is no reason to believe that any observation is a blunder or outlier.

## B. 2 Distance between GPS. $2 \rightarrow$ ST. 1

Mean= $=191.225 \mathrm{~m}$

| Mean <br> $\mathbf{m}$ | Distance <br> $\mathbf{m}$ | V <br> $\mathbf{m m}$ | $\mathbf{m m}$ |
| :--- | :--- | :--- | :--- |
| $\mathbf{1 9 1 . 2 2 5}$ | 191.223 | 2 | $\mathbf{4}$ |
| $\mathbf{1 9 1 . 2 2 5}$ | 191.219 | 6 | $\mathbf{3 6}$ |
| $\mathbf{1 9 1 . 2 2 5}$ | 191.229 | -4 | $\mathbf{1 6}$ |
| $\mathbf{1 9 1 . 2 2 5}$ | 191.226 | -1 | $\mathbf{1}$ |
| $\mathbf{1 9 1 . 2 2 5}$ | 191.225 | 0 | $\mathbf{0}$ |
| $\mathbf{1 9 1 . 2 2 5}$ | 191.227 | -2 | $\mathbf{4}$ |
| $\sum$ |  | $\mathbf{6 1}$ |  |

$\mathrm{S}==3.493 \mathrm{~mm}$
E95 $=1.96 * 3.189=6.846$
Range (191.218-191.232)
There is no reason to believe that any observation is a blunder or outlier.

## B.3Distance between ST. $1 \rightarrow$ ST. 2

Mean $==309.875 \mathrm{~m}$

| Mean <br> $\mathbf{m}$ | Distance <br> $\mathbf{m}$ | V <br> $\mathbf{m m}$ | $\mathbf{m m}$ |
| :--- | :--- | :--- | :--- |
| $\mathbf{3 0 9 . 8 7 5}$ | 309.873 | 2 | $\mathbf{4}$ |

## > 3.C Manually least square:

Calculation of unknowns coordinates:
$\mathrm{X}=I^{T} \cdot W \cdot I^{-1} * I^{T} \cdot W \cdot K$

## - First iteration:

Calculating the Jacobian matrix:

$$
\begin{array}{rll}
\frac{\partial F_{1}}{\partial x_{1}} \frac{\partial F_{1}}{\partial y_{1}} & \frac{\partial F_{1}}{\partial x_{2}} & \frac{\partial F_{1}}{\partial y_{2}} \\
\frac{\partial F_{2}}{\partial x_{2}} \frac{\partial F_{2}}{\partial y_{1}} & \frac{\partial F_{2}}{\partial x_{2}} & \frac{\partial F_{2}}{\partial y_{2}} \\
\frac{\partial F_{3}}{\partial x_{1}} \frac{\partial F_{3}}{\partial y_{1}} & \frac{\partial F_{3}}{\partial x_{2}} & \frac{\partial F_{3}}{\partial y_{2}} \\
\rho \frac{\partial \theta_{1}}{\partial x_{1}} \frac{\partial \theta_{1}}{\partial y_{1}} & \frac{\partial \theta_{1}}{\partial x_{2}} & \frac{\partial \theta_{1}}{\partial y_{2}} \\
\rho \frac{\partial \theta_{2}}{\partial x_{1}} \frac{\partial \theta_{2}}{\partial y_{1}} & \frac{\partial \theta_{2}}{\partial x_{2}} & \frac{\partial \theta_{2}}{\partial y_{2}} \\
\rho \frac{\partial \theta_{3}}{\partial x_{1}} \frac{\partial \theta_{3}}{\partial y_{1}} & \frac{\partial \theta_{3}}{\partial x_{2}} & \frac{\partial \theta_{3}}{\partial y_{2}} \\
\rho \frac{\partial \theta_{4}}{\partial x_{1}} \frac{\partial \theta_{4}}{\partial y_{1}} & \frac{\partial \theta_{4}}{\partial x_{2}} & \frac{\partial \theta_{4}}{\partial y_{2}}
\end{array}
$$

Example of distance derivation at $\mathbf{J}$ matrix:

$$
\frac{\partial F 1}{\partial x_{1}}=\frac{x_{1}-x_{g p s 2}}{l 1 g p s 2} \frac{\partial F 1}{\partial y_{1}}=\frac{y_{1}-y_{g p s 2}}{l 1 g p s 2} \frac{\partial F 1}{\partial x_{2}}=\frac{x_{1}-x_{g p s 2}}{l 1 g p s 2} \frac{\partial F 1}{\partial y_{2}}=\frac{y_{1}-g p s 2}{l 1 g p s 2}
$$

$\frac{\partial F 1}{\partial x_{1}}=\frac{162848.541-162739.009}{191.225}=0.573$
$\frac{\partial F 1}{\partial y_{1}}=\frac{114489.967-114646.713}{191.225}=-0.82$
$\frac{\partial F 1}{\partial x_{2}}=0$
$\frac{\partial F 1}{\partial y_{2}}=0$

Example of angle derivation at J matrix:
$\theta_{1}=360-A Z_{g p s 2 g p s 1}-A Z_{g p s 21}$
$\frac{\partial \theta_{1}}{\partial x_{1}}=-\tan ^{-1} \frac{x_{g p s 1}-x_{g p s 2}}{y_{g p s 1}-y_{g p s 2}}+\tan ^{-1} \frac{x_{1}-x_{g p s 2}}{y_{1}-y_{g p s 2}}$
$=\frac{y_{1}-y_{g p s 2}}{l_{1 g p s 2}{ }^{2}} \partial x_{1}+\frac{x_{g p s 2}-x_{1}}{l_{1 g p s 2}{ }^{2}} \partial y_{1}$
$=\rho \frac{114489.967-114646.713}{191.225^{2}}+\frac{162739.007-162848.541}{191.225^{2}}$
$\frac{\partial \theta_{1}}{\partial x_{1}}=-0.00429$
$\frac{\partial \theta_{1}}{\partial y_{1}}=-0.002995$

$$
\mathrm{k}=\left|\begin{array}{l}
0 \\
0 \\
0.162 \\
0 \\
0 \\
0.000988 \\
-0.000581
\end{array}\right|
$$

The resulted matrix represents the differences in unknown pointes coordinates:

$$
X=\quad \left\lvert\, \begin{aligned}
& -0.16015625 \\
& -0.11206055 \\
& -0.27441406 \\
& -0.42578125
\end{aligned}\right.
$$

The new coordinates of Unknown points is:

| Point\# | X initial | Y initial | X corrected | Y corrected |
| :--- | :--- | :--- | :--- | :--- |
| $\mathbf{1}$ | 162848.541 | 114489.967 | 162848.3808 | 114489.8549 |
| $\mathbf{2}$ | 163139.5782 | 114383.555 | 163139.2976 | 114383.1292 |

- Second iteration:

Repeating the previous steps using the corrected coordinates resulted in from first iteration:

The resulted X matrix is:

$$
\mathrm{X}^{\prime}=\left|\begin{array}{l}
0.00580502 \\
0.00405693 \\
0.00390625 \\
0.01961136
\end{array}\right|
$$

The new coordinates of Unknown points is:

| Point\# | X initial | Y initial | X corrected | Y corrected |
| :--- | :--- | :--- | :--- | :--- |
| $\mathbf{1}$ | 162848.3808 | 114489.8549 | 162848.3866 | $\mathbf{1 1 4 4 8 9 . 8 5 9}$ |
| $\mathbf{2}$ | $\mathbf{1 6 3 1 3 9 . 2 9 7 6}$ | $\mathbf{1 1 4 3 8 3 . 1 2 9}$ | $\mathbf{1 6 3 1 3 9 . 2 9 3 7}$ | $\mathbf{1 1 4 3 8 3 . 1 0 9 6}$ |
